Installation and Deploy

Getting Started

The Secure Cloud Management Platform solution, in line with Gartner's definition indicated in the Reference Documents, is an operational platform that enables the governance, lifecycle management, brokering, and automation of resources managed in a cloud environment.

Requirements

The SCMP solution is designed to run exclusively in Kubernetes environments compliant with the supported versions indicated in the section Supported Kubernetes Versions.

Installation requires the availability of an existing Kubernetes cluster (upstream or managed service) or OpenShift Container Platform, equipped with the necessary resources to host the platform's core components.

In OpenShift environments, it is possible to leverage the benefits of Red Hat certified operators. Alternatively, it is possible to use upstream or managed Kubernetes clusters (EKS, AKS, GKE) with Helm v3.

Recommended Sizing

To ensure optimal performance, it is recommended that the Kubernetes cluster has nodes with the following minimum characteristics:

Type	Role	#qty	vCPU	Memory (GB)	Disk (GB)	Notes
Node	Control Plane	3	8	16	128	Respect native Kubernetes HA
Node	Infra	3	12	24	628	For ingress, logging, monitoring services

Type	Role	#qty	vCPU	Memory (GB)	Disk (GB)	Notes
Node	Worker	4	8	32	128	For SCMP modules and user workloads

⚠ **Note:** Node quantities and sizes may vary based on environment size, number of SCMP modules installed, and workloads to be managed.

Other Requirements

- **"Storage Account" model:** The ABS module retrieves a file containing cost extractions, divided by subsystem, which are then saved in the SCMP database.
- **"Billing storage" model:** The ABS module retrieves a file containing extractions of all subscriptions available in the "billing account"; the results are divided by subsystem and saved in the database.

Cost calculation per single resource:

1. The ABS module sends cost information and information about the resource that generated them to the cost module.
2. The cost module verifies the subsystem configuration to identify the "aggregation type". This parameter indicates which catalog to use (RESOURCES or SKUs) to correctly calculate the price.
3. The cost module checks if the resource identifier (UUID) is present in the SCMP catalog. If present, the system multiplies the usage by the catalog cost.
4. If the resource is not present in the catalog (and therefore does not fall into the previous step), the SCMP will apply the discount/markup percentage configured in the subsystem.

Customer cost recovery and calculation for the AWS provider

- **"Standard" model:** The ABS module queries AWS Cost Explorer APIs to get costs for the last 2 days, saving the data into the SCMP database.
- **"ARN ROLE" model:** The ABS module assumes a specific IAM role (ARN ROLE) to access AWS billing data. Costs are extracted and divided by subsystem, then saved into the SCMP database.

Cost calculation per single resource:

1. The ABS module sends cost information and information about the resource that

generated them to the cost module.

2. The cost module verifies the subsystem configuration to identify the "aggregation type". This parameter indicates which catalog to use (RESOURCES or SKUs) to correctly calculate the price.
3. The cost module checks if the resource identifier (UUID) is present in the SCMP catalog. If present, the system multiplies the usage by the catalog cost.
4. If the resource is not present in the catalog (and therefore does not fall into the previous step), the SCMP will apply the discount/markup percentage configured in the subsystem.

Customer cost recovery and calculation for the Google provider

- **"Standard" model:** The ABS module queries Google Cloud Billing APIs to get costs for the last 2 days, saving the data into the SCMP database.
- **"Dataset Export" model:** The ABS module accesses billing data exported from **BigQuery**. Costs are extracted, divided by subsystem, and saved into the SCMP database.

Cost calculation per single resource:

1. The ABS module sends cost information and information about the resource that generated them to the cost module.
2. The cost module verifies the subsystem configuration to identify the "aggregation type". This parameter indicates which catalog to use (RESOURCES or SKUs) to correctly calculate the price.
3. If the "Cost from USD" field has been selected, the system will use the price in USD (returned by the provider) for the calculation, to which a discount/markup percentage defined in the administration section is applied. Otherwise, the price already converted to EUR is used.
4. The cost module checks if the resource identifier (UUID) is present in the SCMP catalog. If present, the system multiplies the usage by the catalog cost.
5. If the resource is not present in the catalog (and therefore does not fall into the previous step), the SCMP will apply the discount/markup percentage configured in the subsystem.

Customer cost recovery and calculation for Oracle, OracleEXAcc providers

- **"Standard" model:** The ABS module queries ORACLE APIs to get costs for the last 2 days, saving the data into the SCMP database.

Cost calculation per single resource:

1. The ABS module sends cost information and information about the resource that generated them to the cost module.
2. The cost module verifies the subsystem configuration to identify the "aggregation type".

This parameter indicates which catalog to use (RESOURCES or SKUs) to correctly calculate the price.

3. If the "Cost from USD" field has been selected, the system will use the price in USD (returned by the provider) for the calculation, to which a discount/markup percentage defined in the administration section is applied. Otherwise, the price already converted to EUR is used.
4. The cost module checks if the resource identifier (UUID) is present in the SCMP catalog. If present, the system multiplies the usage by the catalog cost.
5. If the resource is not present in the catalog (and therefore does not fall into the previous step), the SCMP will apply the discount/markup percentage configured in the subsystem.

Customer cost recovery and calculation for Kubernetes, OpenShift, vcloudDirector, VMWare, Red Hat Edge providers

- **Standard model:** The ABS module generates Usage data on a 24-hour basis for all resources available in the inventory, as the providers are On-premise and all resources are allocated to the customer.

Cost calculation per single resource:

1. The ABS module sends cost information and information about the resource that generated them to the cost module.
2. The SCMP will apply the discount/markup percentage configured in the cost model.

New subsystem creation

To add a new subsystem to the portal, click on the "menu" available in the top right and select "+ Add new cloud provider".

Name	Type	Creation Date	On-Premises	
Azure Default	Azure	04/01/2023 14:57:48	<input type="checkbox"/>	⋮
VMware Default	VMWare	04/01/2023 15:14:16	<input checked="" type="checkbox"/>	⋮
OpenShift Default	OpenShift	07/03/2023 12:27:23	<input type="checkbox"/>	⋮
Azure Hybrid Default	AzureStackHCI	04/01/2023 15:49:36	<input checked="" type="checkbox"/>	⋮

Figura 65 – Add a new Cloud Provider

The user views the basic data of the subsystem to be entered, explained below.

Parameters shared among providers

On the creation page, we can note 3 fields:

- Name: indicates the name that will be displayed to identify the subsystem.
- Type: indicates the type of cloud provider to which the subsystem belongs.
- Version: the version relative to the provider of the subsystem to be installed.

The screenshot shows a web-based configuration interface for adding a new cloud provider or folder. At the top, there are navigation links for 'Cloud Systems', 'Cloud SIEMs', and 'Key Vaults'. The main title is 'New Cloud Provider/Folder'. Below the title, there is a section titled 'Configuration data' containing three input fields: 'Cloud Provider's Name *', 'Type *', and 'Version *'. Each field has a small asterisk indicating it is required. In the bottom right corner of the form area, there are three buttons: 'Close', 'Test Connection', and 'Save'.

Figura 66 – General parameters of a subsystem

After selecting the type and version of the system, the form updates to display specific parameters based on the selected provider, as each of them manages authentication and resources differently.

All providers require authentication, which may vary by system, for asset retrieval.

This sensitive information, such as passwords or certificates, is securely saved on an infrastructural element that handles data security <https://www.vaultproject.io/>.

Connection verification and saving, shared among providers

For all subsystems, 3 buttons are available at the bottom of the page:

The "Close" button allows cancelling the addition of a new subsystem.

The "Test Connection" button is used to perform a connection test using the entered parameters. In case of errors, the system returns an error message indicating "Error: Unauthorized system" and the button turns red. Otherwise, the button will turn green, and it will be possible to save the subsystem using the "Save" button.

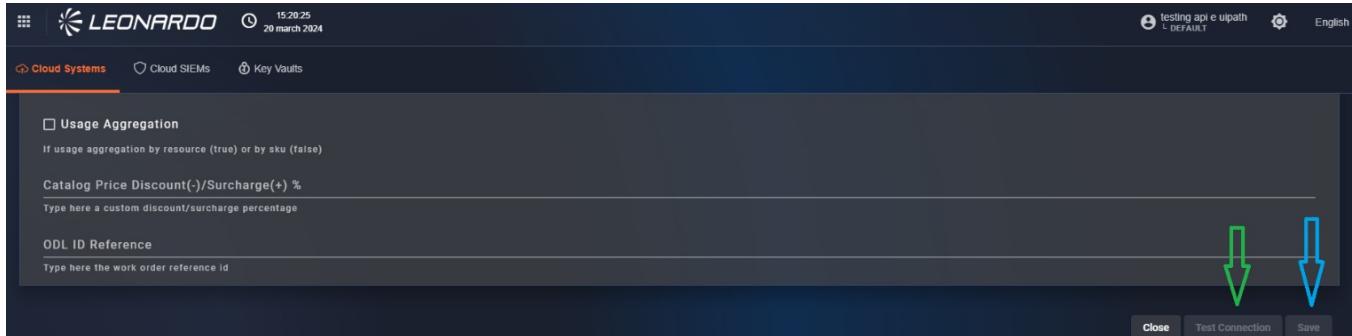

Figura 67 – Connection plates

Upon saving, the SCMP will communicate to the module managing that provider type to load all inventory items, metrics, costs, and security elements into our bus (Kafka).

The same module will subsequently schedule jobs for the periodic update of all existing assets.

After saving, a modal will appear informing the user that a cloud provider cannot be deleted before 24 hours. From the modal, click "OK". After doing so, the user is redirected to the Cloud Provider page.

Amazon Web Services Parameters

Enabled functionalities:

- Catalog item retrieval
- Inventory item retrieval
- Usage metrics retrieval
- Resource cost retrieval
- Security information retrieval
- Resource provisioning
- Service provisioning
- Complex blueprint provisioning

The specific parameters of the Amazon Web Services subsystem to be entered are shown in the table:

The screenshot shows a configuration interface for AWS services. It includes fields for Access Key, Secret Key, Use a role, Resource Aggregator Name, Cost Bucket Path, Cost Export Dataset ID, Usage Aggregation (checked), CMP Catalog Price Discount(-)/Surcharge(+) %, ODL ID Reference, and First Cost Recover (days). Buttons at the bottom include Close, Test Connection, and Save.

Figura 68 – Mask of configuration Amazon Web Services

Parameters indicated with * are mandatory.

Name	Type	Description	Example
AccessKey *	string	The AWS access key is an alphanumeric string that identifies the AWS user.	ZYKZGV AKIS4Y K5IXCA XB

Name	Type	Description	Example
SecretKey *	password	The AWS secret access key is an alphanumeric string used to authenticate the AWS user.	np6Kc_.xwsvhR8Q~rP05fCqYNXmbqfMGQLOEzfMt
use A role	Boolean	Specifies the use of one or more administration roles for authentication on one or more specific accounts within the provider's organization.	true

Name	Type	Description	Example
Arn Role (only if useArole is active)	string	Enter here the Arn ID of the role associated with a specific account for performing the monitoring discovery phase and for provisioning.	arn:aws:iam:{accountID}:role/{roleName}
Audit Arn Role (only if useArole is active)	string	Enter here the Audit Arn ID of the role associated with a specific account for performing the inventory discovery phase.	arn:aws:iam:{accountID}:role/{roleName}

Name	Type	Description	Example
Aggregator Name	string	Enter here the name of the aggregator on resources for using the AWS Config service to support the inventory discovery phase.	aws-{aggregatorName}
Cost Bucket Path	string	Enter here the path of the storage bucket for cost queries.	s3://{bucketPath}
Cost Export Dataset ID	string	Enter here the ID of the cost dataset on which to execute queries.	{databaseName}.{tableName}

Name	Type	Description	Example
usageAggregation	Boolean	Indicates the type of aggregation used for cost calculation (true for resources, false for SKUs).	True
Rate Code Aggregation (only if useAggregation is false)	Boolean	Indicates whether SKU aggregation occurs by SKU ID or by rate code.	true
catalogPriceDiscount	integer	Enter here a discount/mark up to apply to catalog prices for all resources that do not have an SCMP relationship.	5

Name	Type	Description	Example
odIID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001
dataFirstCostRecover	int	Enter the number of days prior to the creation date for which costs should be recovered at the first startup of the subsystem.	15

Provider Configurations

1. S3 Configuration

- Access **Amazon S3**.
- Create or use a bucket for CUR data.
- Enable **Bucket Versioning**.

2. CUR Definition

- Access **Billing and cost management**.
- Go to the Data Exports section.
- Configure a new CUR report as follows:
 - Export details:
 - **Standard data export**: standard export format
 - **Export name**: name of the report
 - Data table content settings:
 - Select **CUR 2.0**.
 - Select **Hourly** as granularity.
 - Data export delivery options:
 - file format: **Parquet**.
 - file versioning: **Overwrite existing data export file**.
 - Data export storage settings:
 - Configure the S3 bucket pointer with the one initially created.
 - Configure the bucket path prefix with **data**.

3. IAM Role Creation for Glue

- Access **IAM**.
- Create a custom role for Amazon Glue

management.

- Assign the following policies:
 - AWSGlueServiceRole (standard AWS policy)
 - Custom policy for S3 bucket access:

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {  
      "Effect": "Allow",  
      "Action": [  
        "s3:GetObject",  
        "s3:PutObject"  
      ],  
      "Resource": [  
        "arn:aws:s3:::{bucketPath}/*"  
      ]  
    }  
  ]  
}
```

4. Glue Database Creation

- Access **AWS Glue**.
- Create the database.

5. Crawler Configuration

- Create a **crawler** in Glue:

- Select the custom role previously created.
- Define the S3 path as s3://{{bucketPath}}/data/.
- Set a **scheduling** (e.g., hourly: 0 * * * *).

6. Usage in Athena

- After the first execution of the crawler, data will be available in **Athena** for queries.
- **⚠ For past historical data, contact AWS support.**

1. AWS Configuration and Aggregators

1. Initial Configuration

- Access **AWS Config** and click **Get started**.
- Create an S3 bucket for aggregated data.
- Enable override for **IAM** resource types and leave the remaining default options; AWS will automatically create the necessary role.

2. Config Aggregator

- Create a **resource aggregator** in the **Aggregators** section.
- Include all regions.

1. IAM User Creation

- Access **IAM** and go to the **Users** section.
- Create a new user or select an existing one.

- Optional: enable console access for the created user.

2. Policies to Assign to the User

- AmazonAthenaFullAccess
- AmazonS3FullAccess
- AWS_ConfigRole
- AWSConfigUserAccess
- AmazonEC2ReadOnlyAccess
- CloudWatchReadOnlyAccess
- Add the following custom policy for managing the CUR bucket:

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {  
      "Sid": "VisualEditor0",  
      "Effect": "Allow",  
      "Action": [ "s3:*" ],  
      "Resource": [  
        "arn:aws:s3:::{bucketPath}/*",  
        "arn:aws:s3:::{bucketPath}/*"  
      ]  
    }  
  ]  
}
```

]
}

3. Access Key

- Generate **Secret Credential**.
- Save the **Access Key** and **Secret Key** (cannot be retrieved later). To enable **role assumption** via STS for cross-account services (e.g., AWS Config), associate the following policy with the created user:

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {  
      "Effect": "Allow",  
      "Action": "sts:AssumeRole",  
      "Resource": [  
        "arn:aws:iam::{accountID}:role/{roleName}  
      ]  
    }  
  ]  
}
```

Azure Parameters

Enabled functionalities:

- Catalog item retrieval
- Inventory item retrieval
- Usage metrics retrieval
- Resource cost retrieval
- Security information retrieval
- Resource provisioning
- Service provisioning
- Complex blueprint provisioning

The specific parameters of the Azure subsystem to be entered are shown in the table:

The screenshot shows a configuration interface for an Azure provider. Key fields include:

- Cloud Provider's Name ***: Azure
- Type ***: Azure
- Version ***: 2020-08-01
- Connection Parameters** section:
 - Client ID ***: Type here the client id
 - Client Secret ***: Type here the client secret
 - Tenant ID ***: Type here the tenant id
 - Subscription ID ***: Type here the subscription id
- Usage Aggregation**: A checkbox labeled "If usage aggregation by resource (true) or by sku (false)".
- Catalog Price Discount(-)/Surcharge(+) %**: A field for entering a custom discount/surcharge percentage.
- ODL ID Reference**: A field for entering the work order reference id.

Figura 69 – Azure configuration mask

Parameters indicated with * are mandatory.

Name	Type	Description	Example
------	------	-------------	---------

Name	Type	Description	Example
clientId *	string	The unique ID of the client connecting to the Azure Cloud subsystem. This ID is used to identify the client and authorize access to the subsystem's resources.	5a85c16c 6ad-49db- a58e- e209- ee11f53d6 c6b

Name	Type	Description	Example
clientSecret *	password	The client's secret key, used to authenticate the client with the Azure Cloud subsystem. The secret key must be kept confidential and not shared with anyone.	np6Kc_.x wsvhR8Q ~rP05fCq YNXmbqf MGQLOE zfMt

Name	Type	Description	Example
tenantId *	string	The ID of the Azure tenant to which the Azure Cloud subsystem belongs. A tenant is an organizational entity in Azure representing a company or organization.	88414773 3-ff13- 4783- a765- 83418377 3083

Name	Type	Description	Example
subscriptionId *	string	The ID of the Azure subscription used to access the Azure Cloud subsystem. A subscription is a contract for using Azure services.	88414773 3-ff13- 4783- a765- 83418377 3083

Name	Type	Description	Example
usageAggregation	boolean	Indicates whether "usage" aggregation is enabled for the subscription. When this option is enabled, subsystem costs will be grouped by Resource Type.	false

Name	Type	Description	Example
Storage account ID**	String	Enter the path where cost exports are performed.	/subscriptions/{{subscription}}/resourceGroups/{{resourcegroup}}/providers/Microsoft.Storage/storageAccounts/{{storageaccount}}
Cost from Billing storage**	boolean	Select this checkbox to retrieve costs in "billing Account" format.	true

Name	Type	Description	Example
catalogPriceDiscount	integer	Enter here a discount/markup to apply to catalog prices for all resources that do not have an SCMP relationship.	5
odlID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001

Name	Type	Description	Example
dataFirstCostRecoverint		Enter the number of days prior to the creation date for which costs should be recovered at the first startup of the subsystem.	15

Variables for cost calculation

Variables indicated with ** are exclusive, so only one can be selected at a time. Each variable activates a different system for cost calculation, and if more than one is set, subsystem saving will be prevented. Specifically, we can:

- Use the "Storage account ID" field to retrieve costs via automatic extractions performed individually per subsystem (only if the storage belongs to the same tenant).

- Use the "Cost from Billing storage" field to retrieve costs at the billing account level, thus using a single file for all available subscriptions (Contributor and Blob Contributor permissions are required).
- By leaving "Cost from Billing storage" and "Cost from billing storage" empty, the SCMP will retrieve costs using the Azure APIs prepared for daily costs.

This distinction is necessary to prevent Azure APIs from responding with a 429 error due to a large number of requests. Additionally, to use the methods described previously, the Azure system must be correctly configured and the entered credentials must have all necessary permissions.

AzureStack Parameters

Enabled functionalities:

- Catalog item retrieval
- Inventory item retrieval
- Usage metrics retrieval
- Resource cost retrieval
- Security information retrieval
- Resource provisioning
- Service provisioning
- Complex blueprint provisioning

The specific parameters of the AzureStack subsystem to be entered are shown in the table:

Leonardo Cyber & Security Solutions

15 Dec 2025

09.00

Secure Cloud Management Platform

The screenshot shows a configuration interface for a new cloud provider. The top navigation bar includes the Leonardo logo, a search bar, and tabs for 'Cloud Systems', 'Cloud Services', and 'Key Results'. The main title is 'New Cloud Provider/Folder'. The configuration data section starts with 'Cloud Provider's Name' set to 'AzureStack' and 'Version' set to '2020-09-01'. Below this are 'Connection Parameters' which include fields for 'Cloud ID', 'Tenant ID', 'Client Secret', 'Endpoint ID', 'AAD Endpoint', 'Subscriptions ID', 'Client Client ID', 'Client Client Secret', 'Client Tenant ID', 'Client Subscription ID', 'Location', 'Total VMs Capacity', 'Total RAM Capacity (MB)', 'Total Storage Size Capacity (GB)', and 'Cache Disk Efficiency (%)'. At the bottom of the form are sections for 'URLs for Reference' and buttons for 'Clear', 'Next Step', and 'Save'.

Figura 70 – AzureStack configuration mask

Parameters indicated with * are mandatory.

Name	Type	Description	Example
------	------	-------------	---------

Name	Type	Description	Example
clientId *	string	The unique ID of the client connecting to the Azure Cloud subsystem. This ID is used to identify the client and authorize access to the subsystem's resources.	5a85c16c6ad-49db-a58e-e209-ee11f53d6c6b

Name	Type	Description	Example
clientSecret *	password	The client's secret key, used to authenticate the client with the Azure Cloud subsystem. The secret key must be kept confidential and not shared with anyone.	np6Kc_.xwsvhR8Q~rP05fCqYNXmbqfMGQLOEzfMt

Name	Type	Description	Example
tenantId *	string	The ID of the Azure tenant to which the Azure Cloud subsystem belongs. A tenant is an organizational entity in Azure representing a company or organization.	8841477 33-ff13- 4783- a765- 8341837 73083
subscriptionId *	string	The ID of the Azure subscription used to access the Azure Cloud subsystem. A subscription is a contract for using Azure services.	8841477 33-ff13- 4783- a765- 8341837 73083

Name	Type	Description	Example
usageAggregation	boolean	Indicates whether "usage" aggregation is enabled for the subscription. When this option is enabled, subsystem costs will be grouped by Resource Type.	false
catalogPriceDiscount	integer	Enter here a discount/mark up to apply to catalog prices for all resources that do not have an SCMP relationship.	5

Name	Type	Description	Example
odlID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001
dataFirstCostRecover	int	Enter the number of days prior to the creation date for which costs should be recovered at the first startup of the subsystem.	15

For On-Premise providers, in particular, data on infrastructure capacity is requested so that the SCMP can perform preliminary calculations in multiple scenarios.

For example, during provisioning, to ensure that the maximum allowed capacity of the provider is not exceeded.

AzureStack HCI Parameters

Enabled functionalities:

- Catalog item retrieval
- Inventory item retrieval
- Usage metrics retrieval
- Resource cost retrieval
- Security information retrieval
- Resource provisioning
- Service provisioning
- Complex blueprint provisioning

The specific parameters of the AzureStack HCI subsystem to be entered are shown in the table:

The screenshot shows a configuration interface for the AzureStack HCI subsystem. The top navigation bar includes the Leonardo logo, user information (14:06:10, 21 March 2024), and language selection (English). The main form is titled 'AzureStack HCI Parameters' and contains the following fields:

- Connection Parameters:**
 - Bridge Machine Username *
 - Bridge Machine Password *
 - Bridge Machine IP Address *
- Client ID:** Type here the client id
- Client Secret:** Type here the client secret
- Tenant ID ***
- Subscription ID ***
- Location *** Select the sub-system location
- Total VCPU Capacity *** Total virtual CPU of the sub-system
- Total RAM Capacity (MB) *** Total RAM of the sub-system, in MB
- Total Storage Size Capacity (GB) *** Total storage size of the sub-system, in GB
- Catalog Price Discount(%) / Surcharge(%)** Type here a custom discount/surcharge percentage
- ODI ID Reference** Type here the work order reference id

Figura 71 – Configuration mask AzureStack HCI

Parameters indicated with * are mandatory.

Name	Type	Description	Example
------	------	-------------	---------

Name	Type	Description	Example
clientId *	string	The unique ID of the client connecting to the Azure Cloud subsystem. This ID is used to identify the client and authorize access to the subsystem's resources.	5a85c16c6ad-49db-a58e-e209-ee11f53d6c6b

Name	Type	Description	Example
clientSecret *	password	The client's secret key, used to authenticate the client with the Azure Cloud subsystem. The secret key must be kept confidential and not shared with anyone.	np6Kc_.xwsvhR8Q~rP05fCqYNXmbqfMGQLOEzfMt

Name	Type	Description	Example
tenantId *	string	The ID of the Azure tenant to which the Azure Cloud subsystem belongs. A tenant is an organizational entity in Azure representing a company or organization.	8841477 33-ff13- 4783- a765- 8341837 73083
subscriptionId *	string	The ID of the Azure subscription used to access the Azure Cloud subsystem. A subscription is a contract for using Azure services.	8841477 33-ff13- 4783- a765- 8341837 73083

Name	Type	Description	Example
usageAggregation	boolean	<p>Indicates whether "usage" aggregation is enabled for the subscription.</p> <p>When this option is enabled, subsystem costs will be grouped by Resource Type.</p>	false
catalogPriceDiscount	integer	<p>Enter here a discount/mark up to apply to catalog prices for all resources that do not have an SCMP relationship.</p>	5

Name	Type	Description	Example
odlID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001
dataFirstCostRecovery	int	Enter the number of days prior to the creation date for which costs should be recovered at the first startup of the subsystem.	15

For On-Premise providers, in particular, data on infrastructure capacity is requested so that the SCMP can perform preliminary calculations in multiple scenarios.

For example, during provisioning, to ensure that the maximum allowed capacity of the provider is not exceeded.

AzureStack Hybrid Cloud Parameters

Enabled functionalities:

- Catalog item retrieval
- Inventory item retrieval
- Usage metrics retrieval
- Resource provisioning
- Service provisioning
- Complex blueprint provisioning

The specific parameters of the AzureStack Hybrid cloud subsystem to be entered are shown in the table:

The screenshot shows a configuration interface for the AzureStack Hybrid Cloud. The top navigation bar includes the Leonardo logo, the date (21 March 2024), and a search bar. The main section is titled 'AzureStack Hybrid Cloud Parameters' and contains the following fields:

- Connection Parameters:**
 - Bridge Machine Username *
 - Bridge Machine Password *
 - Bridge Machine IP Address *
 - bridge is on cluster
 - Cluster Name
 - Network Controller URI
- System Resources:**
 - Total VCPU Capacity *
 - Total RAM Capacity (MB) *
 - Total Storage Size Capacity (GB) *
 - Catalog Price Discount(+) / Surcharge(+) %
 - DDL ID Reference

At the bottom right of the form are buttons for 'Close', 'Test Connection', and 'Save'.

Figura 72 – Configuration mask AzureStack Hybrid Cloud

Parameters indicated with * are mandatory.

Name	Type	Description	Example
------	------	-------------	---------

Name	Type	Description	Example
clientId *	string	The unique ID of the client connecting to the Azure Cloud subsystem. This ID is used to identify the client and authorize access to the subsystem's resources.	5a85c16 c6ad- 49db- a58e- e209- ee11f53 d6c6b

Name	Type	Description	Example
clientSecret *	password	The client's secret key, used to authenticate the client with the Azure Cloud subsystem. The secret key must be kept confidential and not shared with anyone.	np6Kc_.xwsvhR8Q~rP05fCqYNXmbqfMGQLOEzfMt

Name	Type	Description	Example
tenantId *	string	The ID of the Azure tenant to which the Azure Cloud subsystem belongs. A tenant is an organizational entity in Azure representing a company or organization.	8841477 33-ff13- 4783- a765- 8341837 73083
subscriptionId *	string	The ID of the Azure subscription used to access the Azure Cloud subsystem. A subscription is a contract for using Azure services.	8841477 33-ff13- 4783- a765- 8341837 73083

Name	Type	Description	Example
usageAggregation	boolean	<p>Indicates whether "usage" aggregation is enabled for the subscription.</p> <p>When this option is enabled, subsystem costs will be grouped by Resource Type.</p>	false
catalogPriceDiscount	integer	<p>Enter here a discount/mark up to apply to catalog prices for all resources that do not have an SCMP relationship.</p>	5

Name	Type	Description	Example
odlID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001
dataFirstCostRecoverint		Enter the number of days prior to the creation date for which costs should be recovered at the first startup of the subsystem.	15

For On-Premise providers, in particular, data on infrastructure capacity is requested so that the SCMP can perform preliminary calculations in multiple scenarios.

For example, during provisioning, to ensure that the maximum allowed capacity of the provider is not exceeded.

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

RedHat Edge device Parameters

Enabled functionalities:

- Catalog item retrieval
- Inventory item retrieval
- Usage metrics retrieval
- Resource cost retrieval
- Security information retrieval
- Resource provisioning
- Service provisioning
- Complex blueprint provisioning

The specific parameters of the Google Cloud subsystem to be entered are shown in the table.

The screenshot shows a dark-themed web interface for managing cloud providers. At the top, there's a header with the Leonardo logo, a timestamp (14:19:20), a date (07 november 2024), and a dropdown for language (English). Below the header, a navigation bar includes links for Cloud Systems, Cloud SIEMs, Key Vaults, CommVaults, and Confidential Computing. The main content area shows a breadcrumb path: Administration / Cloud System / New. A modal window titled "New Cloud Provider/Folder" is open. Inside the modal, there are two main sections: "Configuration data" and "Connection Parameters". In the "Configuration data" section, there are fields for "Cloud Provider's Name *" (set to "Edge") and "Type *" (set to "Edge"). In the "Connection Parameters" section, there are fields for "Client ID *" and "Client Secret *". At the bottom of the modal, there are three buttons: "Close", "Test Connection", and "Save".

Figura 73 – Edge configuration mask

Parameters indicated with * are mandatory.

Name	Type	Description	Example
------	------	-------------	---------

Name	Type	Description	Example
client_id *	string		1048224 7326110 0667392
clientSecret *	string	Client secret used for connection	82hg7ds 1h0sds7 392
odlID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001
catalogPriceDiscount	integer	Enter here a discount/markup to apply to catalog prices for all resources that do not have an SCMP relationship.	10

Name	Type	Description	Example
dataFirstCostRecover	int	Enter the number of days prior to the creation date for which costs should be recovered at the first startup of the subsystem.	15

PROVIDER side configuration

To be able to add the system to the SCMP, some configurations need to be performed on the provider's portal.

Specifically:

- Create a service account
 1. Access <https://console.redhat.com>
 2. In the top right, click on the  Settings icon → Service Accounts → Create service account.
 3. Enter Name and Description → Create.
 4. Immediately copy the Client ID and Client Secret (the secret will not be shown again).

- Assign permissions

1. Go to Settings → User Access → Groups
2. Create a group that contains the following permissions/roles:

Service	Recommended role
Edge Management (fleet, update)	Edge Management Administrator or User
Image Builder	Image Builder Administrator or User
Insights Inventory (host read)	Insights Inventory Viewer

- In the Service accounts tab of the group → Add service account → select the newly created account.
- Rotate and revoke permissions
 1. Portal → Service Accounts → menu (:)
 2. Select **Reset credentials** to regenerate only the Client Secret.
 3. Select **Delete service account** to permanently decommission the automation.

With this configuration, you can securely orchestrate the entire edge lifecycle – from image generation to update rollout – without ever using personal credentials.

Google Cloud Parameters

Enabled functionalities:

Catalog item retrieval

- Inventory item retrieval
- Usage metrics retrieval
- Resource cost retrieval
- Security information retrieval
- Resource provisioning
- Service provisioning
- Complex blueprint provisioning

The specific parameters of the Google Cloud subsystem to be entered are shown in the table. The “Service account” field can be entered either automatically or manually as described in the paragraph.

The screenshot shows the configuration interface for a Google Cloud subsystem. It includes fields for 'Project ID', 'Private Key', 'Client ID', 'Authentication URLs', and 'Usage Aggregation' options. A 'Service account' section is present but not filled. The interface is part of the Leonardo Cyber & Security Solutions platform.

Figura 74 – Google configuration mask

Parameters indicated with * are mandatory (available below the service account section).

Name	Type	Description	Example
------	------	-------------	---------

Name	Type	Description	Example
serviceAccount *	object	Connection file generated from the Google console	service_account.json
discoveryProjectId *	string	Identifier of the project for which discovery will be performed	The project-547280
costExportProjectId	string	Dataset ID of the cost export service account if the dataset is different from the ProjectID	test-customer .test_customer.gc p_billing _export_resource _v1_015 27DF_51 B683_E B2A9

Name	Type	Description	Example
usageAggregation	boolean	<p>Indicates whether "usage" aggregation is enabled for the subscription.</p> <p>When this option is enabled, subsystem costs will be grouped by Resource Type.</p>	false
Cost from USD Currency	boolean	<p>Indicates whether the final cost is calculated from the price in USD or EUR.</p>	true

Name	Type	Description	Example
providerPriceDiscount ** (only if costFromUSDCurrency is true)	integer	Enter here a discount/mark up to apply to provider prices in USD for all resources.	30
catalogPriceDiscount **	integer	Enter here a discount/mark up to apply to catalog prices for all resources that do not have an SCMP relationship.	-5

Name	Type	Description	Example
odlID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001
dataFirstCostRecover	int	Enter the number of days prior to the creation date for which costs should be recovered at the first startup of the subsystem.	15

Variables for cost calculation

The variables indicated with ** are used differently for

"customer" cost calculation depending on the presence of the "Cost from USD Currency" field. Specifically:

- If the field is deactivated, the value entered in "catalogPriceDiscount" is used as a percentage added to the price retrieved from the provider (or discounted if the value is negative), as for other providers.
- If the field is activated, the value entered in "catalogPriceDiscount" and the "providerPriceDiscount" value are used as a coefficient multiplied by the cost in USD retrieved from the provider.

This distinction is necessary to prevent Azure APIs from responding with a 429 error due to a large number of requests. Additionally, to use the methods described previously, the Azure system must be correctly configured and the entered credentials must have all necessary permissions.

The screenshot shows a configuration interface for a new cloud provider or folder. At the top, it says 'New Cloud Provider/Folder'. Below that, there's a section for 'Configuration data' where 'Cloud Provider's Name' is set to 'Google'. There's also a checkbox for 'Is a folder of projects' which is checked. Under 'Connection Parameters', there's a note about uploading a JSON file and a prominent yellow button labeled 'Click here to import from service_account.json'. A red arrow points to this button. The rest of the form is filled with various fields for authentication (like Project ID, Private Key, Client ID, etc.) and certificates, all enclosed in a large yellow box. At the bottom, there are sections for 'Active Project ID' and 'Cost Export Dataset ID'.

Figura 75 – Configuration file loading

By uploading the file, the form is automatically completed with the necessary parameters, but it is also possible to enter them manually (yellow box in the image), following the table. All fields are mandatory:

Name	Type	Description	Example
Type	string	Enter the name of the configured authentication type.	service account

Name	Type	Description	Example
project_id *	string	Enter here the unique ID of the project associated with the service account.	The project-3678
private_key_id *	string	Enter here the unique ID of the service account's private key.	55cl03ea1e4a0e0a13e6

Name	Type	Description	Example
client_e-mail *	string	The unique email address of the service account. It is used to identify the service account when authenticating to Google Cloud APIs.	userminim

Name	Type	Description	Example
client_id *	string	The client ID of the service account. It is a unique identifier used to identify the service account in Google Cloud.	10487320667
auth_uri *	string	The URI used for authenticating the service account to Google Cloud APIs.	https://accounts.google.com/o/oauth2/a

Name	Type	Description	Example
token_uri *	string	The URI used to obtain an access token for the service account.	https://auth2.googleapis.com/token
auth_provider_x509_cert_url*	string	The URL of the X.509 certificate used for authenticating the service account.	https://www.googleapis.com/oauth2/v1/certs

Name	Type	Description	Example
client_x509_cert_url *	string	The URL of the X.509 certificate in the client.	https://www.leap.m/r/v1/nata/mysql/account/%40ectN.gse/acco.com

Provider Configuration

1. Access GCP Console
 - Go to <https://console.cloud.google.com/>
 - Log in with your Google Cloud account.
2. Create or Identify the Service Account (SA) From the console, select the project at the top where you want to add (or where it is already present) the service account. From the console, to create the service account, go to IAM and admin > Service accounts. Click on Create service account. Assign an ID (e.g.,

my-service-account), name, and description, then Create. On the service account page, go to the Keys section. Click on Add key and select Create new key. Choose JSON format and click Create. Download and keep the JSON file in a safe place.

3. Associate Permissions with the Service Account

On the same service accounts page, find the newly created account and click on its name. Go to the Permissions section and in the table below, next to the service account, in the Inheritance column, click on Edit principal. In the pop-up menu, select the appropriate roles for the service account. Below is the minimal list of roles for the SCMP: - App Engine Admin - BigQuery Data Transfer Service Agent - Cloud OS Config Service Agent - Compute Admin - Kubernetes Engine Service Agent - OS Inventory Viewer - Security Center Service Agent Click Save and add the permissions to the service account.

4. Enable Service APIs

Go back to the console home. Select the project at the top where the service account is present. Go to APIs and services. At the top, click on + Enable APIs

and services. Search for the API services to enable in the search bar and click on their name. Once inside the API service, select Enable to activate it; below are the API services for the SCMP: - Cloud Monitoring API - Compute Engine API - Cloud Asset API - BigQuery API - Cloud Resource Manager API - OS Config API - Security Command Center API - Cloud Billing API - Service Usage API - Cloud Dataplex API

5. Cost Dataset

If the cost dataset is located in a different service account than the one you want to integrate, specify the complete connection string to the relevant dataset in the Cost Export Dataset ID text box (in the subsystem creation module present in SCMP administration) (e.g., projectId.datasetName.tableName).

Kubernetes Parameters

Enabled functionalities:

- Catalog item retrieval
- Inventory item retrieval
- Usage metrics retrieval
- Resource cost retrieval
- Security information retrieval
- Resource provisioning
- Service provisioning

- Complex blueprint provisioning

The specific parameters of the Kubernetes subsystem to be entered are shown in the table.

Figura 76 – Configuration mask Kubernetes

Parameters indicated with * are mandatory.

Name	Type	Description	Example
Certificate authority data *	string	Enter the data related to the certificate used by the user for connection.	Sgeijesf90434n7u3h97ef

Name	Type	Description	Example
Kubernetes API server URI *	string	Enter the URL of the server to connect to.	https://www.google.com/info
User certificate Data *	String	Enter the certificate related to the user used for connection.	---begin private key--- fnbsujffsf oije ...
User key Data *	String	Enter the key related to the user used for connection.	Sf8j9jts4ewht7h3wfwj908w
User token *	String	Secret token related to the user used for connection to the provider.	Sf8eufce9sfber4543jh8ddsfh89r43
User name *	String	Enter the username used for authentication.	administrator

Name	Type	Description	Example
Label selector	string	Enter here a selector to filter resources retrieved by the SCMP.	Name=rossi
catalogPriceDiscount	integer	Enter here a discount/markup to apply to catalog prices for all resources that do not have an SCMP relationship.	-10
odlID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001

Provider Configuration

The standard authentication method is via the parameters contained in the kubeconfig file. The kubeconfig defines: API server endpoint (server) Authentication method (client certificates, tokens, oidc, etc.) Default namespace Context Authentication: Via client certificates (client-certificate-data and client-key-data)

Or via token (token in the user context)

Minimal kubeconfig example:

```
apiVersion: v1 kind: Config clusters: - cluster: certificate-authority-data: server: https:// name: my-cluster contexts: - context: cluster: my-cluster user: my-user name: my-context current-context: my-context users: - name: my-user user: token:
```

OpenShift Parameters

Enabled functionalities:

- Catalog item retrieval
- Inventory item retrieval
- Usage metrics retrieval
- Resource cost retrieval
- Security information retrieval
- Resource provisioning
- Service provisioning
- Complex blueprint provisioning

The specific parameters of the OpenShift subsystem to be entered are shown in the table:

The screenshot shows a configuration interface for an OpenShift provider. The 'Cloud Provider's Name' is set to 'OpenShift'. The 'Type' is also 'OpenShift'. The 'Version' is '4.12'. Under 'Connection Parameters', there are fields for 'Username', 'Password', 'API Server Port', and 'API Url'. A 'Label Selector' section contains a checked checkbox for 'Discovery all Namespace'. In the 'ODL ID Reference' section, the 'First Cost Recover (days)' is set to '2'. At the bottom, there are 'Close', 'Test Connection', and 'Save' buttons.

Figura 77 – OpenShift configuration mask

Parameters indicated with * are mandatory.

Name	Type	Description	Example
Username *	string	The username of the OpenShift user that will be used for connection to the provider.	name.surname@mail.com

Name	Type	Description	Example
Password *	password	The client's password, used to authenticate the client with the subsystem. The secret key must be kept confidential and not shared with anyone.	np6KcX mbqfMG QLOEzf Mt
API server port *	integer	The port on which the OpenShift APIs are listening.	8090
API url *	string	The OpenShift URL on which to make requests.	www.google.com

Name	Type	Description	Example
discover all Namespaces	boolean	If the user has administrator permissions on all OpenShift "projects," all namespaces will be retrieved.	false
Namespace selector (only visible if "discover all namespaces" is active)	selection	If the user has visibility of a limited number of namespaces, it is necessary to enter the list of enabled namespaces here.	demo,inf os,produ ction

Name	Type	Description	Example
odIID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001
dataFirstCostRecover	int	Enter the number of days prior to the creation date for which costs should be recovered at the first startup of the subsystem.	15

User authorizations

If the "Discover all namespaces" field is selected, it is necessary that the user has administration permissions on **ALL** namespaces, otherwise, the system cannot be added.

This distinction is necessary because the OpenShift system automatically blocks incorrectly authorized requests.

Provider Configuration

To connect an OpenShift cluster system, it is sufficient to have a named or impersonal user with adequate privileges (e.g., cluster-admin or otherwise sufficient for the intended use) on the cluster.

Authentication:

Username and Password

Notes:

In OpenShift, it is very common to use specially created :

Users can be both human (named) and technical (impersonal).

Oracle Parameters

Enabled functionalities:

- Catalog item retrieval
- Inventory item retrieval
- Resource cost retrieval
- Security information retrieval

The specific parameters of the Oracle subsystem to be entered are shown in the table:

The screenshot shows a configuration interface for an Oracle subsystem. At the top, there are navigation links for Cloud Systems, Cloud SIEMs, and Key Vaults. The main section is titled "Configuration data" and contains the following fields:

- Cloud Provider's Name ***: Type: Oracle, Version: v1
- Connection Parameters** (grouped under "User OcId *"):
 - Type here the user ocid
 - Fingerprint *: Type here the fingerprint
 - Tenancy OcId *: Type here the tenancy ocid
 - Region *: Type here the region
 - Realm: Type here the realm
 - Private Key *: Type here the private key
- Catalog Price Discount()/Surcharge(+) %**: Type here a custom discount/surcharge percentage
- ODL ID Reference**: Type here the work order reference id

At the bottom right of the form are buttons for Close, Test Connection, and Save.

Figura 78 – Oracle configuration mask

Parameters indicated with * are mandatory.

Name	Type	Description	Example
------	------	-------------	---------

Name	Type	Description	Example
username *	string	The username used for authentication with OCI.	ocid5.us er.oc77. aaabnbt haj6pnvs b2gqnaa aaait3mq zekefmlh wkige2w xna6hfaj 3f6njma
fingerprint *	string	Is a unique value that identifies the device, used for authentication with OCI.	6a:f4:6e: 9a:73:95 :27:d5:6 4:8d11:a 3:f5:0e:f b:f4:

Name	Type	Description	Example
tenantId *	string	The ID of the OCI tenant to connect to.	ocid5.tenancy.oc77...aaabnbthaj6pnvsb2gqnaaaaait3mqzekefmlhwkige2wxna6hfaj3f6njma
region *	string	The region is the specific geographic location where OCI resources are located.	eu-dcc-rome-1

Name	Type	Description	Example
Realm	string	The name of the logical container that groups OCI resources and their associated costs.	personal-realm.it
keyFile *	password	A PEM file containing the public and private key used for authentication.	" ----- BEGIN PRIVATE KEY--- -- MIIJQgIBADANB ..."

Name	Type	Description	Example
usageAggregation	boolean	Indicates whether "usage" aggregation is enabled for the subscription. When this option is enabled, subsystem costs will be grouped by Resource Type.	false
catalogPriceDiscount	integer	Enter here a discount/mark up to apply to catalog prices for all resources that do not have an SCMP relationship.	-10

Name	Type	Description	Example
odlID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001
dataFirstCostRecover	int	Enter the number of days prior to the creation date for which costs should be recovered at the first startup of the subsystem.	15

Provider Configuration

Procedure for creating parameters for external integration in Oracle Cloud Infrastructure (OCI): 1. Access OCI Console

Go to <https://cloud.oracle.com/>
Log in with your Oracle Cloud account.

1. Create or Identify the IAM User

In the main console menu, go to Identity & Security > Users. Select an existing user or create a new user for the integration: Click on Create User if you need to create one. Assign a name and an email. Save.

2. Associate the user with a group with adequate permissions

After creating the user, you must associate it with a group that has permissions for the resources you want to manage via API. Go to Identity > Groups. Select a group (e.g., Administrators or create a custom group). Click on Add User to Group and add the newly created user.

3. Generate the API key (Key File)

Go back to the user page (Identity > Users > select

user). Go to the API Keys tab. Click on Add API Key. You have two options: Upload an existing public key (RSA public). Or generate a new public and private key from the console (download the private key). Select “Generate API Key Pair” to locally generate the key: Download the private key (.pem) and save it securely (it is your Key File). The public key will be automatically associated with the user.

4. Obtain the required parameters

User OCID (User OCID): Go to Identity > Users > select user. You will find the user OCID on the user page (format ocid1.user.oc1..aaaaaaaa...).

Fingerprint: It is the fingerprint of the public API key you added (displayed in the API Keys section).

Tenant OCID (Tenant OCID / Main Compartment OCID): Go to Identity > Tenancy (click on the tenancy name in the top left). You will find the tenancy OCID (it is the main tenant, e.g.,

ocid1.tenancy.oc1..aaaaaaaa...). Region: Choose your OCI region (e.g., eu-frankfurt-1, us-ashburn-1, etc.). You can find it in the top right of the console or in Governance & Administration > Regions. Realm: It is usually oc1 for most public OCI tenants. You can verify this in the documentation or via CLI if

necessary.

Summary of parameters and where to find them

Parameter	Where to find it / how to obtain it	User OCID
Identity > Users > select user	> OCID Fingerprint	
Identity > Users > API Keys	> fingerprint	Tenant OCID
Identity > Tenancy > OCID Region	Top right of the console (e.g., eu-frankfurt-1)	Region
(standard OCI realm)	Realm	Generally oc1
Key File	Private .pem key generated at the time of API Key creation	

OracleExAcc Parameters

Enabled functionalities:

- Catalog item retrieval
- Inventory item retrieval
- Resource cost retrieval
- Security information retrieval

The specific parameters of the OracleExAcc subsystem to be entered are shown in the table:

Leonardo Cyber & Security Solutions

15 Dec 2025

09.00

Secure Cloud Management Platform

The screenshot shows a configuration dialog titled "New Cloud Provider/Folder". The "Cloud Provider's Name" field is set to "OracleExAcc". The "Type" dropdown is set to "OracleExAcc". The "Version" dropdown is set to "v1". The "User Ocid" field contains placeholder text "Type here the user ocid". The "Fingerprint" field contains placeholder text "Type here the fingerprint". The "Tenancy Ocid" field contains placeholder text "Type here the tenancy ocid". The "Region" field contains placeholder text "Type here the region". The "Private Key" field contains placeholder text "Type here the private key" and includes a note about CMP Catalog Price Discount(%) and Surcharge(+) %. The "ODL ID Reference" field contains placeholder text "Type here the work order reference id" and includes a note about First Cost Recover (days) and the number of days for first cost recover flow.

Figura 79 – Configuration mask OracleExAcc

Parameters indicated with * are mandatory.

Name	Type	Description	Example
------	------	-------------	---------

Name	Type	Description	Example
username *	string	The username used for authentication with OCI.	ocid5.user.oc77.aabnbthaj6pnvsb2gqnaaaaait3mqzekefmlhwkige2wxna6hfaj3f6njma
fingerprint *	string	Is a unique value that identifies the device, used for authentication with OCI.	6a:f4:6e:9a:73:95:27:d5:64:8d11:a3:f5:0e:fb:f4:

Name	Type	Description	Example
tenantId *	string	The ID of the OCI tenant to connect to.	ocid5.tenancy.oc77...aaabnbthaj6pnvsb2gqnaaaaait3mqzekefmlhwkige2wxna6hfaj3f6njam
region *	string	The region is the specific geographic location where OCI resources are located.	eu-dcc-rome-1

Name	Type	Description	Example
Private key *	password	A PEM file containing the public and private key used for authentication.	" ----- BEGIN PRIVATE KEY----- MIIJQgIB ADANB ... "
catalogPriceDiscount	integer	Enter here a discount/mark up to apply to catalog prices for all resources that do not have an SCMP relationship.	-10

Name	Type	Description	Example
odlID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001
dataFirstCostRecover	int	Enter the number of days prior to the creation date for which costs should be recovered at the first startup of the subsystem.	15

VCloud Parameters

Enabled functionalities:

- Catalog item retrieval

- Inventory item retrieval
- Usage metrics retrieval
- Resource cost retrieval
- Security information retrieval

The specific parameters of the VCloudDirector subsystem to be entered are shown in the table.

Figura 80 – VCloudDirector configuration mask

Parameters indicated with * are mandatory.

Name	Type	Description	Example
url *	string	The address of the VCloudDirector server to connect to.	https://url.westeurope.com/tenant/or-g-zzg-435832

Name	Type	Description	Example
tenantId *	string	The VCloudDirector tenant ID is the unique identifier of the tenant to connect to.	org-zzg-435832
Use providerPermission	boolean	To be activated if the user has all provider-level authorizations; if not activated, not all information is retrieved, only that of the enabled organizations.	true

Name	Type	Description	Example
token *	password	The authentication token for the VCloudDirector is a secret string used to authenticate the user with the VCloudDirector.	aesZo6LextKTQx92VoRpyzaesZo6LextKT
Location	String	Enter the region to which the VCloudDirector resources belong.	Eu west
Location	string	Enter the geographical location of the system.	OnPremise

Name	Type	Description	Example
catalogPriceDiscount	integer	Enter here a discount/markup to apply to catalog prices for all resources that do not have an SCMP relationship.	5
odlID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001

VMWare Parameters

Enabled functionalities:

- Catalog item retrieval
- Inventory item retrieval
- Usage metrics retrieval

- Resource cost retrieval
- Security information retrieval
- Resource provisioning
- Service provisioning
- Complex blueprint provisioning

The specific parameters of the VMWare subsystem to be entered are shown in the table:

The screenshot shows a configuration interface for a VMWare subsystem. The 'Type' field is set to 'VMWare' and the 'Version' field is set to '7.0.0'. The 'Connection Parameters' section requires a 'Username' and 'Password'. The 'Location' section allows selecting a sub-system location. Other fields include 'Total VCPU Capacity', 'Total RAM Capacity (MB)', 'Total Storage Size Capacity (GB)', 'Catalog Price Discount(-)/Surcharge(+) %', and 'ODL ID Reference'. Buttons at the bottom include 'Close', 'Test Connection', and 'Save'.

Figura 81 – Configuration mask VMWare

Parameters indicated with * are mandatory.

Name	Type	Description	Example
------	------	-------------	---------

Name	Type	Description	Example
clientId *	string	<p>The unique ID of the client connecting to the Azure Cloud subsystem.</p> <p>This ID is used to identify the client and authorize access to the subsystem's resources.</p>	5a85c16 c6ad- 49db- a58e- e209- ee11f53 d6c6b

Name	Type	Description	Example
clientSecret *	password	The client's secret key, used to authenticate the client with the Azure Cloud subsystem. The secret key must be kept confidential and not shared with anyone.	np6Kc_.xwsvhR8Q~rP05fCqYNXmbqfMGQLOEzfMt

Name	Type	Description	Example
tenantId *	string	The ID of the Azure tenant to which the Azure Cloud subsystem belongs. A tenant is an organizational entity in Azure representing a company or organization.	8841477 33-ff13- 4783- a765- 8341837 73083
subscriptionId *	string	The ID of the Azure subscription used to access the Azure Cloud subsystem. A subscription is a contract for using Azure services.	8841477 33-ff13- 4783- a765- 8341837 73083

Name	Type	Description	Example
usageAggregation	boolean	<p>Indicates whether "usage" aggregation is enabled for the subscription.</p> <p>When this option is enabled, subsystem costs will be grouped by Resource Type.</p>	false
catalogPriceDiscount	integer	<p>Enter here a discount/mark up to apply to catalog prices for all resources that do not have an SCMP relationship.</p>	5

Name	Type	Description	Example
odlID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001
daysFirstCostRecovery	int	Enter the number of days prior to the creation date for which costs should be recovered at the first startup of the subsystem.	15

For On-Premise providers, in particular, data on infrastructure capacity is requested so that the SCMP can perform preliminary calculations in multiple scenarios.

For example, during provisioning, to ensure that the maximum allowed capacity of the provider is not exceeded.

Folders

Azure Folder

To allow the SCMP to leverage all the potential offered by the "Azure" provider, the ability to configure "Folders" has been introduced.

During the creation of a provider, by selecting the "Azure" type, we can observe the presence of an exclusive field for the provider:

- A confirmation box to indicate to the SCMP if the provider being added is a "Folder".

The screenshot shows the configuration interface for a new cloud provider. The provider is identified as 'Azure'. A specific field, 'Is a Folder of projects', is highlighted with a red box and a red arrow pointing to it. This indicates that the provider is being configured as a folder.

Figura 82 – Option folder Azure

The specific parameters of the Azure subsystem to be entered are shown in the following table:

Leonardo Cyber & Security Solutions

15 Dec 2025

09.00

Secure Cloud Management Platform

The screenshot shows a configuration interface for an 'Azure Folder'. At the top, there's a header bar with the Leonardo logo, the date '29 July 2024', and a user 'cmp_admin'. Below the header, a navigation bar has 'Cloud Systems' selected. The main area contains a form with the following fields:

- Connection Parameters**
- Client ID ***: Type here the client id
- Client Secret ***: Type here the client secret
- Tenant ID ***: Type here the tenant id
- Usage Aggregation**: A checkbox labeled 'If usage aggregation by resource (true) or by sku (false)'.
- Catalog Price Discount(-)/Surcharge(+) %**: Type here a custom discount/surcharge percentage.
- ODL ID Reference**
- Days first cost recover**: A numeric input field with the value '2'.

At the bottom right of the form are 'Close', 'Test Connection', and 'Save' buttons.

Figura 83 – Configuration mask Azure Folder

Parameters indicated with * are mandatory.

Name	Type	Description	Example
------	------	-------------	---------

Name	Type	Description	Example
clientId *	string	The unique ID of the client connecting to the Azure Cloud subsystem. This ID is used to identify the client and authorize access to the subsystem's resources.	5a85c16 c6ad- 49db- a58e- e209- ee11f53 d6c6b

Name	Type	Description	Example
clientSecret *	password	<p>The client's secret key, used to authenticate the client with the Azure Cloud subsystem. The secret key must be kept confidential and not shared with anyone.</p>	np6Kc_. xwsvhR8 Q~rP05f CqYNX mbqfMG QLOEzf Mt

Name	Type	Description	Example
tenantId *	string	The ID of the Azure tenant to which the Azure Cloud subsystem belongs. A tenant is an organizational entity in Azure representing a company or organization.	8841477 33-ff13- 4783- a765- 8341837 73083

Name	Type	Description	Example
usageAggregation	boolean	<p>Indicates whether "usage" aggregation is enabled for the subscription.</p> <p>When this option is enabled, subsystem costs will be grouped by Resource Type.</p>	false
catalogPriceDiscount	integer	<p>Enter here a discount/mark up to apply to catalog prices for all resources that do not have an SCMP relationship.</p>	5

Name	Type	Description	Example
odlID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001
datsFirstCostRecover	int	Enter the number of days prior to the creation date for which costs should be recovered at the first startup of the subsystem.	15

Google Cloud Folders

To allow the SCMP to leverage all the potential offered by the "Google Cloud" provider, the ability to configure "Folders" has been introduced, along with the option to import the file

generated from the provider's console to simplify its insertion.

During the creation of a provider, by selecting the "Google Cloud" type, we can observe the presence of 2 exclusive fields for the provider:

1. A confirmation box to indicate to the SCMP if the provider being added is a "Folder".
2. A box where, by clicking inside, it will be possible, through the Windows file selection window, to insert the "JSON" file exported directly from the Google console.

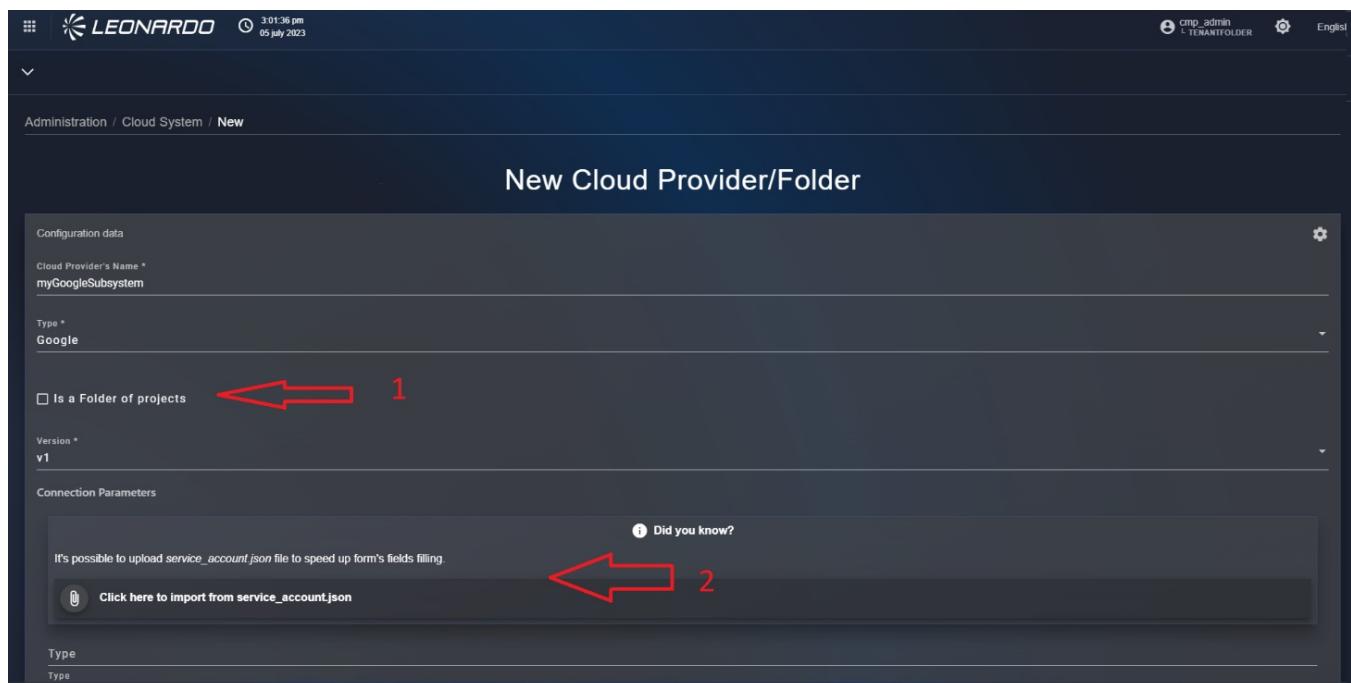

Figura 84 – Specific parameters of Google Cloud

The specific parameters for the Google Folder to be entered are shown in the table:

Name	Type	Description	Example
serviceAccount	object	Connection file generated from the Google console	service_account.json

Name	Type	Description	Example
costExportDatasetID	string	Enter the ID of the dataset to be used for information retrieval.	Projectid.dataset.table
usageAggregation	boolean	Indicates whether "usage" aggregation is enabled for the subscription. When this option is enabled, subsystem costs will be grouped by Resource Type.	false

Name	Type	Description	Example
Cost from USD Currency	Boolean	Indicates whether the final cost is calculated from the price in USD or EUR.	true
providerPriceDiscount (only if costFromUSDCurrency is true)	integer	Enter here a discount/mark up to apply to provider prices in USD for all resources.	30
Cost cross project	Boolean	Indicates whether to retrieve costs for all projects in the billing account or only for the current project.	true

Name	Type	Description	Example
catalogPriceDiscount	integer	Enter here a discount/mark up to apply to catalog prices for all resources that do not have an SCMP relationship.	-20
odlID	string	Enter here the ID of the work order that will be associated with the subsystem and will be inserted as a tag on all subsystem resources.	ODL001

Name	Type	Description	Example
datsFirstCostRecover	int	Enter the number of days prior to the creation date for which costs should be recovered at the first startup of the subsystem.	15

Mandatory Enabled Services

The following services must be enabled on the service account used:

- [bigquery.googleapis.com](https://www.googleapis.com/auth/bigquery)
- [cloudresourcemanager.googleapis.com](https://www.googleapis.com/auth/cloudresourcemanager)
- [cloudasset.googleapis.com](https://www.googleapis.com/auth/cloudasset)
- [cloudbilling.googleapis.com](https://www.googleapis.com/auth/cloudbilling)
- [compute.googleapis.com](https://www.googleapis.com/auth/compute)
- [container.googleapis.com](https://www.googleapis.com/auth/container)
- [monitoring.googleapis.com](https://www.googleapis.com/auth/monitoring)

The "ServiceAccount" field can be automatically entered by uploading the file or manually by entering the fields available in the form.

After configuring a "Folder" type system, it will be displayed in both the cloud provider list and the folders page.

Name	Type	Creation Date	On-Premises	State
CMP Managed Folder	GOOGLE	20/05/2024 15:53:40	<input type="checkbox"/>	●

Figura 85 – See folders

From the "Cloud System" page of the "Administration" module, click the "Folders" tab in the top right, which will display the list of folders configured in the tenant.

Within the page, the same view, modify, and delete operations can be performed on folders as those performed on the "Cloud Provider" page.

The screenshot shows a dark-themed web interface for the Leonardo Secure Cloud Management Platform. At the top, there's a header with the Leonardo logo, the date and time (3:10:33 pm, 05 July 2023), user information (cmp_admin, TENANTFOLDER), and language settings (English). Below the header, a navigation bar has three items: 'Cloud Systems' (selected), 'Cloud SIEMs', and 'Key Vaults'. The main content area is titled 'Administration / Cloud System'. A red arrow points from the left towards the 'Folders' tab in the top right corner of the content area. The content area displays a table titled 'Folder list' with one row. The table columns are 'Name', 'Type', 'Creation Date', and 'On-Premises'. The single row shows 'ASL02 Folder' as the name, 'Google' as the type, '30/06/2023 16:21:22' as the creation date, and an empty checkbox for 'On-Premises'.

Name	Type	Creation Date	On-Premises
ASL02 Folder	Google	30/06/2023 16:21:22	<input type="checkbox"/>

Figura 86 – Access to Folders

When accessing a "Folder" in "View" mode, scrolling down the page reveals a list of subsystems present in the provider and their status information:

- In green, we can see a subsystem correctly configured in the provider that the SCMP automatically adds to the system and will be visible in the "Cloud Providers" section and in all SCMP functionalities.
- In red, we can see an incorrectly configured subsystem which, after appropriate modifications from the "Google Cloud" console, can be accepted by the SCMP.

SIEM

The user can create a SIEM provider by clicking on the tab depicting a shield, located in the top bar, after accessing the "Cloud SIEMs" page, in the top right, click on the hamburger menu and then click on "Attach a SIEM".

Leonardo Cyber & Security Solutions

15 Dec 2025

09.00

Secure Cloud Management Platform

Figura 88 – Creation of a SIEM cloud provider

On the "Add SIEM" page, fill in all fields in the "General properties" section. After doing this, fill in all fields in the "SIEM's properties" section according to the table:

Figura 89 – Compilation of the form to create a SIEM provider

Parameters indicated with * are mandatory.

Name	Type	Description	Example
clientId *	string	Unique ID of the SIEM to connect to, provided by the SIEM during application registration.	1b16698f-2df5-ed44-86b9ed-4b42c1fe7ad9
clientSecret *	password	The secret to use for the connection, provided by the SIEM during application registration.	1b16698f-2df5-ed44-86b9ed-4b42c1fe7ad9
resourceGroup *	string	The Azure resource group where the SIEM is hosted.	myGroup

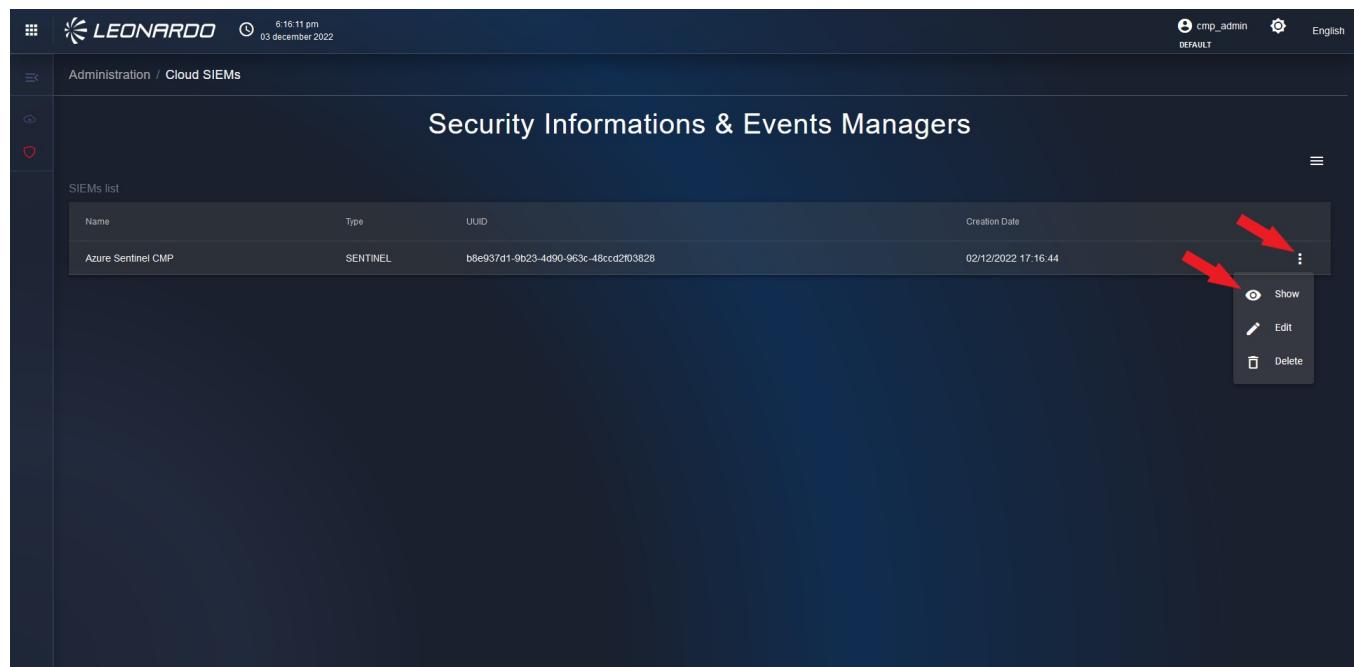

Name	Type	Description	Example
subscriptionId *	string	The Azure subscription ID associated with the SIEM.	1b16698f-2df5-ed44-86b9ed-4b42c1fe7ad9
tenantId *	string	The Azure tenant ID associated with the SIEM.	1b16698f-2df5-ed44-86b9ed-4b42c1fe7ad9
workspaceID*	string	The Log Analytics workspace ID associated with the SIEM.	1b16698f-2df5-ed44-86b9ed-4b42c1fe7ad9
workspaceName*	string	The name of the Log Analytics workspace associated with the SIEM.	theWorkspaceName

Finally, in the bottom right, click the "Save" button. Afterward, a popup will appear confirming

the SIEM's creation, and the user will be redirected to the list of SIEMs.

Viewing, modifying, and deleting

To view a SIEM, next to it, click on the kebab menu and then click "Show". At this point, the user is on the "Show SIEM" page where data can be viewed but not modified. After viewing the data, in the bottom right, click the "Close" button. After this, the user is back on the list of SIEMs.

The screenshot shows the Leonardo Secure Cloud Management Platform interface. The top navigation bar includes the Leonardo logo, the date (03 December 2022), and the time (6:16:11 pm). The top right corner shows the user role (cmp_admin) and language (English). The main title is "Security Informations & Events Managers". On the left, there is a sidebar with icons for Administration, Cloud SIEMs, and other services. The central area displays a table titled "SIEMs list" with one row. The row contains the following columns: Name (Azure Sentinel CMP), Type (SENTINEL), UUID (b8e937d1-9b23-4d90-963c-48cccd2f03828), and Creation Date (02/12/2022 17:16:44). To the right of the table is a vertical kebab menu with options: Show (highlighted with a red arrow), Edit, and Delete.

Figura 90 – Access to SIEM in display mode

The screenshot shows a web-based management interface for Leonardo's Secure Cloud Management Platform. At the top, there is a header bar with the Leonardo logo, user information (cmp_admin, DEFAULT), and language selection (English). Below the header, the main content area has a dark background. The title of the page is "Show SIEM b8e937d1-9b23-4d90-963c-48ccd2f03828". On the left side, there is a sidebar with navigation links: Administration / Cloud SIEMs / Show SIEM. The main content area is divided into sections: "General properties" and "SIEM's properties". Under "General properties", the fields shown are Name (Azure Sentinel CMP), Type (SENTINEL), and UUID (b8e937d1-9b23-4d90-963c-48ccd2f03828). Under "Creation Date", the value is 2022-12-02T17:16:44.02. Under "SIEM's properties", the fields shown are clientId, clientSecret, and resourceGroup (sentineltest).

Figura 91 – SIEM in visual mode

To modify a SIEM, next to it, click on the kebab menu and then click "Edit". At this point, you are on the "Edit SIEM" page where fields can be modified.

After modifying the fields of interest, in the bottom right, click the "Update" button. After this, a popup will appear confirming the SIEM's modification, and the user will be back on the list of SIEMs.

Secure Cloud Management Platform

The screenshot shows the 'Administration / Cloud SIEMs' section. A table lists a single SIEM entry: 'Azure Sentinel CMP' (Type: SENTINEL, UUID: b8e937d1-9b23-4d90-963c-48cccd2f03828, Creation Date: 02/12/2022 17:16:44). To the right of the table is a context menu with three options: 'Show', 'Edit', and 'Delete'. A red arrow points to the 'Delete' option.

Figura 94 – Option to delete a SIEM "Delete"

The screenshot shows the same 'Administration / Cloud SIEMs' section. A confirmation dialog box is displayed over the table, asking 'Are you sure you want to delete the SIEM b8e937d1-9b23-4d90-963c-48cccd2f03828?'. The dialog has 'Cancel' and 'Remove' buttons. The background table remains visible.

Figura 95 – Confirm to delete a SIEM

Secrets Managers

The user can create a secret manager by clicking on the tab depicting a padlock, located in the top bar, as shown in the figure.

After accessing the “Secret Manager” page, at the top right, click on the burger menu and then click on “Add a secret manager”

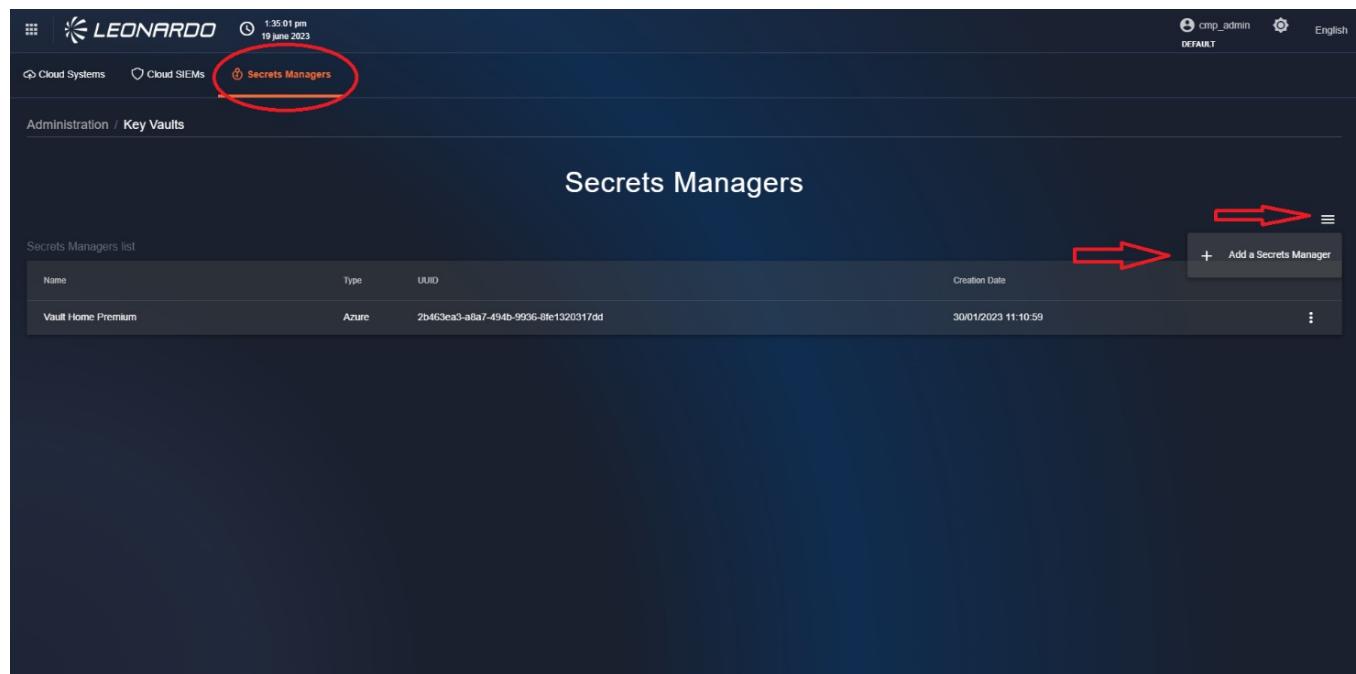

Figura 96 – Add a new Secret Manager

Here is an example form for adding a Secret manager from an Azure type provider (selectable from the "Type" dropdown at the top of the page).

After entering all the required parameters, click the "Save" button at the bottom to complete the entry, and the user will be redirected to the "Secret manager" list where the newly created component can be viewed.

Azure Key Vault

The specific parameters for an Azure Key Vault to be entered are shown in the table:

The screenshot shows a configuration interface for an Azure Key Vault. At the top, there are navigation links for Cloud Systems, Cloud SIEMs, and Key Vaults, with Key Vaults being the active tab. The main area contains several input fields:

- General properties:** Name*
- Azure Key Vault:**
 - clientid *
 - clientSecret *
 - resourceGroup *
 - subscriptionId *
 - tenantId *
 - privateUrl *
- Secrets Manager's properties:** (This section is currently empty)

At the bottom right of the form is a "Save" button.

Figura 97 – Configuration mask Azure key vault

Parameters indicated with * are mandatory.

Name	Type	Description	Example
clientId *	string	Unique identifier of the key vault.	09f8985-9f89d0-4623-98982-5a510fd3d2
clientSecret *	password	A secret key used to authenticate the application with the Key Vault.	np6Kc_.xwsvhR8Q~rP05fCqYNXmbqfMGQLOEzfMt

Name	Type	Description	Example
resourceGroup *	string	The Azure resource group where the Key Vault is hosted.	resourceGroupName
subscriptionId *	string	The Azure subscription ID associated with the Key Vault.	09f8985-9f89d0-4623-98982-5a510fd3d2
tenantId	string	The Azure tenant ID associated with the Key Vault.	09f8985-9f89d0-4623-98982-5a510fd3d2
privateUrl	string	Private access URL to the Key Vault.	https://vault.azure.net/vault

Table 25 – Azure Key Vault specific fields

Google Secret Manager

The specific parameters for the Google Secret Manager to be entered are shown in the following table:

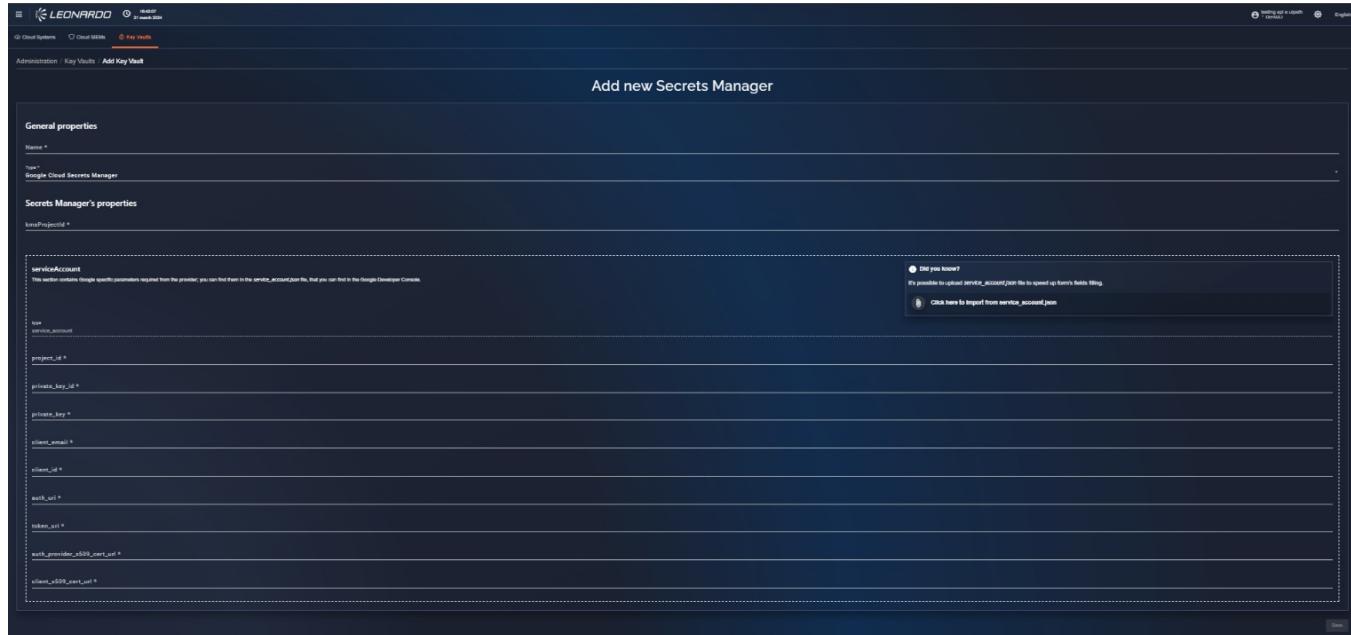

Figura 98 – Google Secret Manager configuration mask

Parameters indicated with * are mandatory.

Name	Type	Description	Example
kmsProjectId *	string	The Google Cloud Platform (GCP) project ID associated with the Google Cloud Key Management Service (KMS).	5a85c16c 6ad- 49db- a58e- e209- ee11f53d 6c6b
serviceAccount *	object	Connection file generated from the Google console.	service_account.json

It is possible to manually enter the parameters present in the "service_account.json" file into the displayed form if you do not want to upload it. All parameters are mandatory:

Name	Type	Description	Example
Type	string	Enter the name of the configured authentication type.	service account
project_id *	string	Enter here the unique ID of the project associated with the service account.	The project-3678
private_key_id *	string	Enter here the unique ID of the service account's private key.	55ck03ea1e4a0e0af3e6

Name	Type	Description	Example
client_e-mail *	string	The unique email address of the service account. It is used to identify the service account when authenticating to Google Cloud APIs.	userminim

Name	Type	Description	Example
client_id *	string	The client ID of the service account. It is a unique identifier used to identify the service account in Google Cloud.	10487320667
auth_uri *	string	The URI used for authenticating the service account to Google Cloud APIs.	https://accounts.google.com/o/oauth2/a

Name	Type	Description	Example
token_uri *	string	The URI used to obtain an access token for the service account.	https://auth2.googleapis.com/token
auth_provider_x509_cert_url*	string	The URL of the X.509 certificate used for authenticating the service account.	https://www.googleapis.com/oauth2/v1/certs

Name	Type	Description	Example
client_x509_cert_url *	string	The URL of the X.509 certificate in the client.	https://www.leap.m/rv1/nata/mysqlseacco%40ectN.gseacco.com

Viewing, modifying, and deleting a system

It is possible to view the data of a Secret Manager, within the list, by clicking on the kebab menu corresponding to a manager, and then on "Show".

Secure Cloud Management Platform

The screenshot shows the 'Secrets Managers' section of the Leonardo platform. It lists a single entry: 'Vault Home Premium' (Type: Azure, UUID: 2b463ea3-a6a7-494b-9936-8fe1320317dd, Creation Date: 30/01/2023 11:10:59). To the right of each entry is a vertical ellipsis menu with three options: 'Show', 'Edit', and 'Delete'. A large red arrow points from the bottom right towards the 'Delete' button for the 'Vault Home Premium' entry.

Figura 102 – Starting for the Elimination of a Secret Manager

Done that, a modal will appear where you need to click on the “Remove” button

The screenshot shows the same 'Secrets Managers' list as before, but now a modal dialog box is overlaid on the screen. The dialog is titled 'Confirm Secrets Manager deletion' and contains the message 'Are you sure you want to delete the Secrets Manager Vault Home Premium?'. At the bottom of the dialog are two buttons: 'Cancel' (gray) and 'Remove' (red).

Figura 103 – Confirm deletion of the Secret Manager

At this point, the Secret manager will no longer be present in the list, and the asset removal flow will be launched on the resource-manager.

Backup

The user is given the ability to connect the SCMP to a CommVault to subsequently retrieve and display information related to backups and operations performed by the Vault.

To access this functionality, you need to select the "CommVault" tab available at the top of the "Administration" functionality.

We will be directed to the page containing the list of all configured "CommVaults", and by clicking on the menu on the right, it will be possible to add a new CommVault.

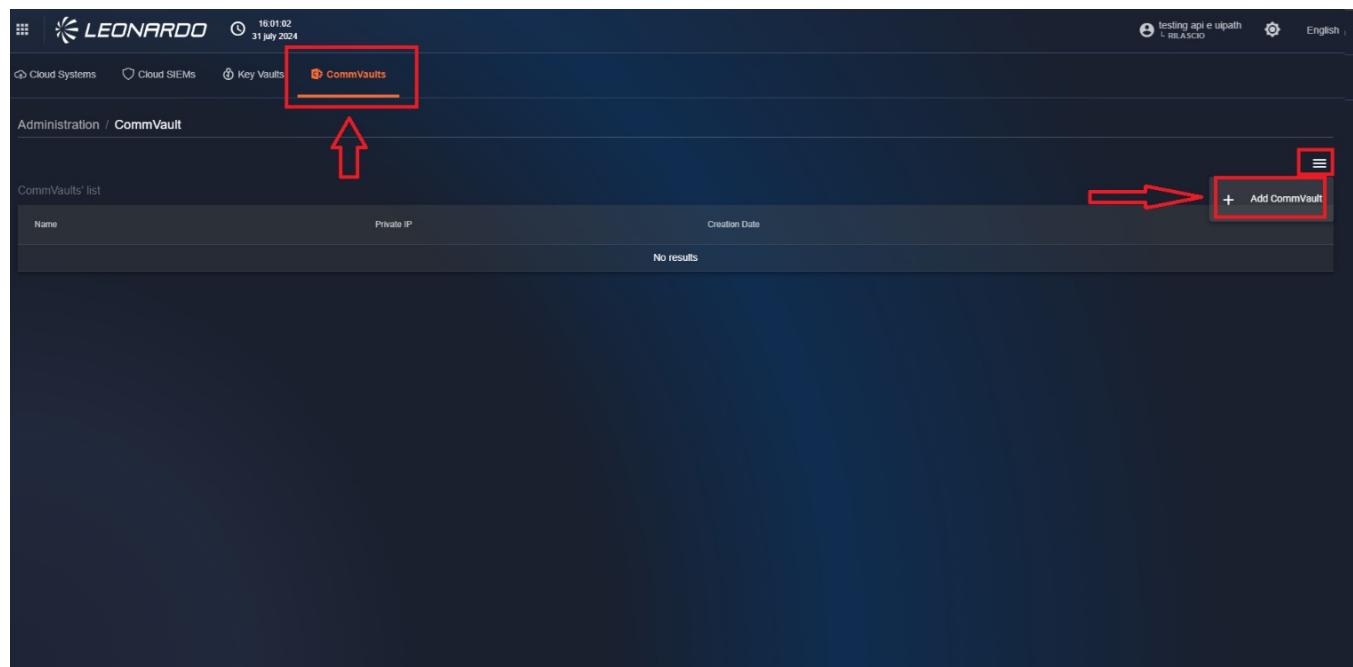

Figura 104 – Accesso a CommVault

On this page, after entering the access credentials (IP address, username, and password), we can click the "Test connection" button to confirm the correct data entry and then confirm the entry via the "Save" button.

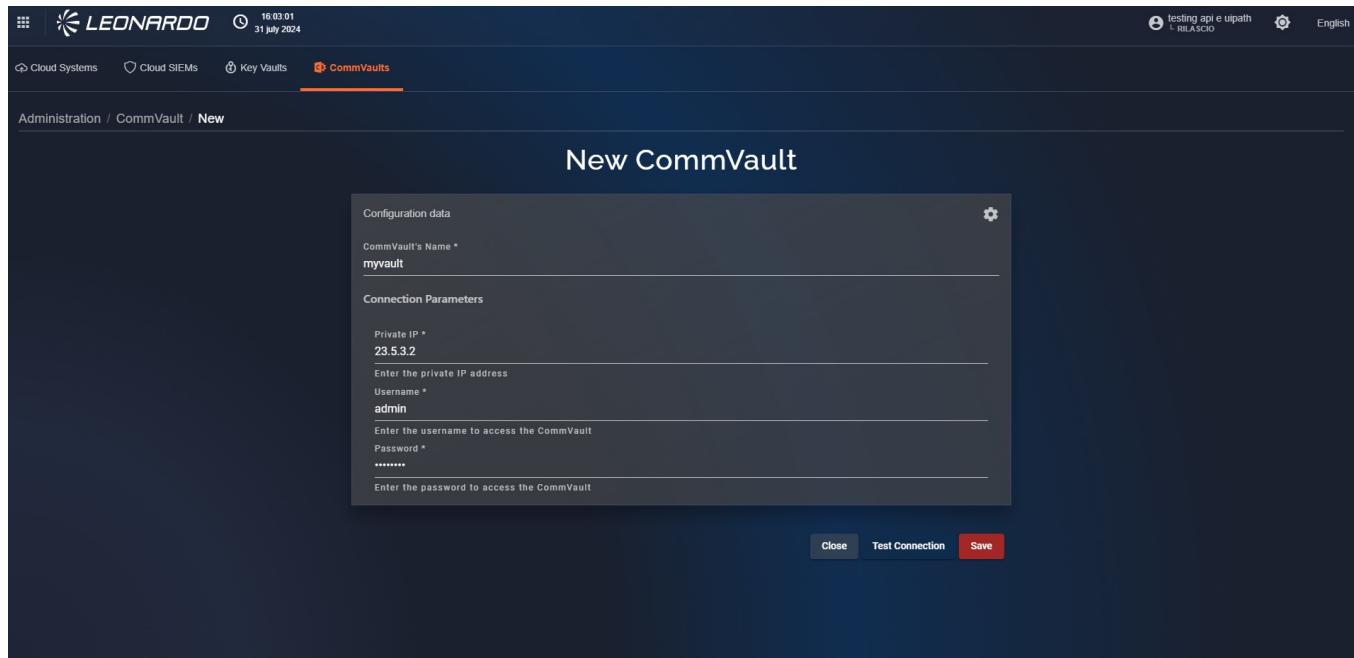

Figura 105 – Creation of connection to a CommVault

Confidential computing

In the Confidential Computing section, the user is given the ability to add a connection to a "Remote Attestation" service within the SCMP to control and view information regarding the confidentiality status of machines managed by the service.

To access this functionality, you need to select the "Confidential computing" tab available at the top in the "Administration" functionality.

We will be directed to the page containing the list of all configured "Remote attestation" services, and by clicking on the menu on the right, it will be possible to add a new connection.

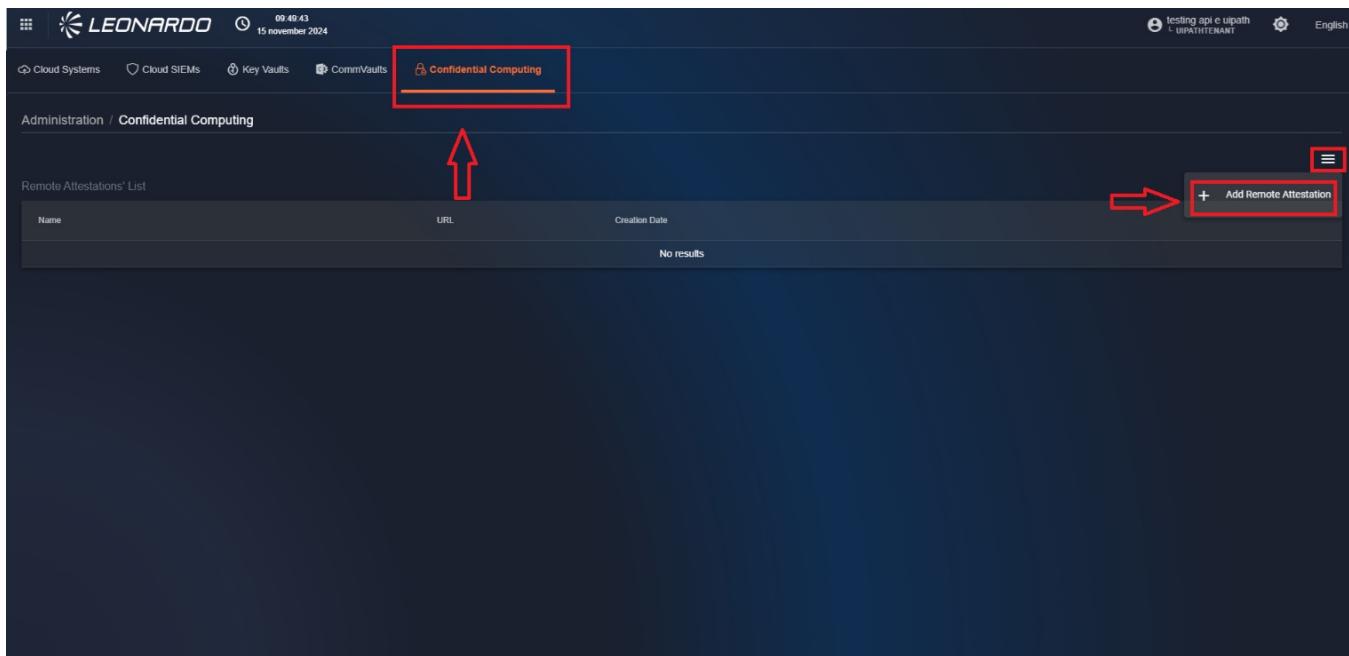

Figura 106 – Accesso a Confidential Computing

On this page, after entering the access credentials (IP address, username, and password), we can click the "Test connection" button to confirm the correct data entry and then confirm the entry via the "Save" button.

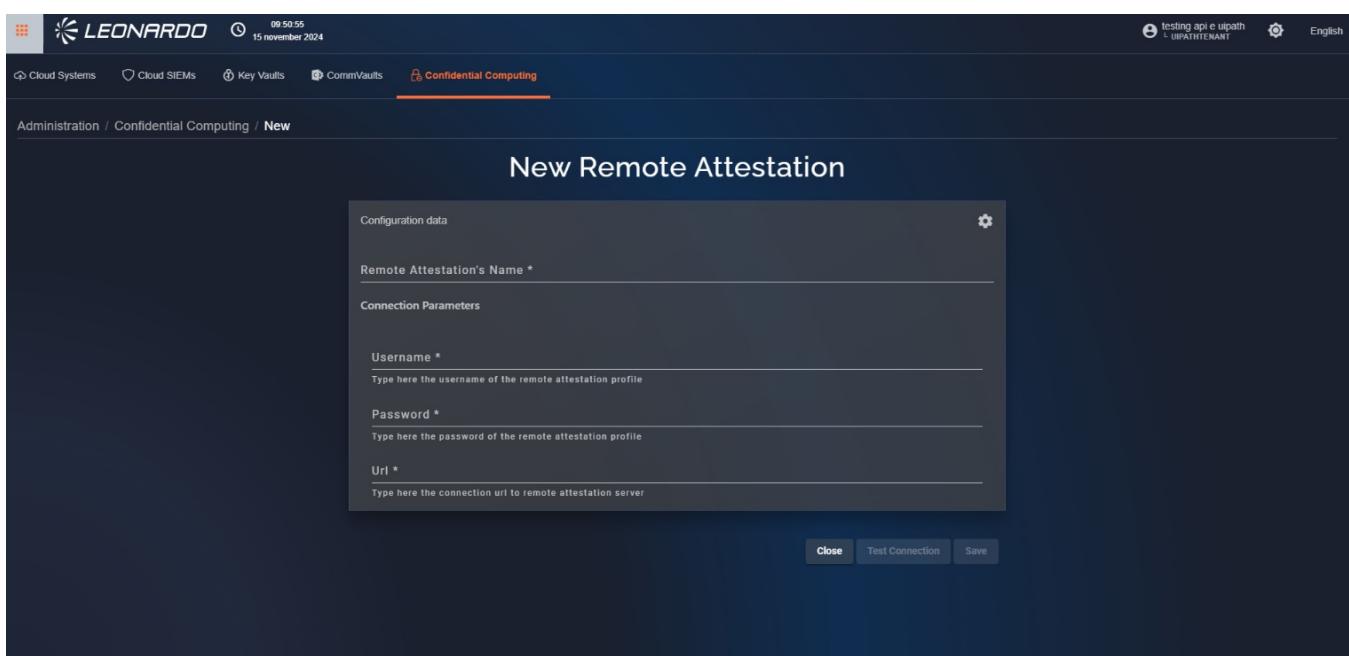

Figura 107 – Creation of connection to a service "Remote Attestation"

5 Dashboard

Accessing the SCMP, the homepage presents a summary of four sections: inventory, monitoring, costs, and security.

In particular:

- The Inventory section shows:
- A pie chart regarding SCMP resources (for each resource of a single provider, an SCMP type instance is created, so the data can be considered as the sum of all resources present across all providers).
- A pie chart for each provider type.
- The monitoring section shows the most populated metrics with their relative usage.
- The costs section shows a summary of costs for the last 30 days.
- The security section shows the most severe vulnerabilities.

The title of each section is clickable and leads to the specific dashboard.

Figura 108 – Dashboard section "Inventory"

Figura 109 – Dashboard section "Monitoring"

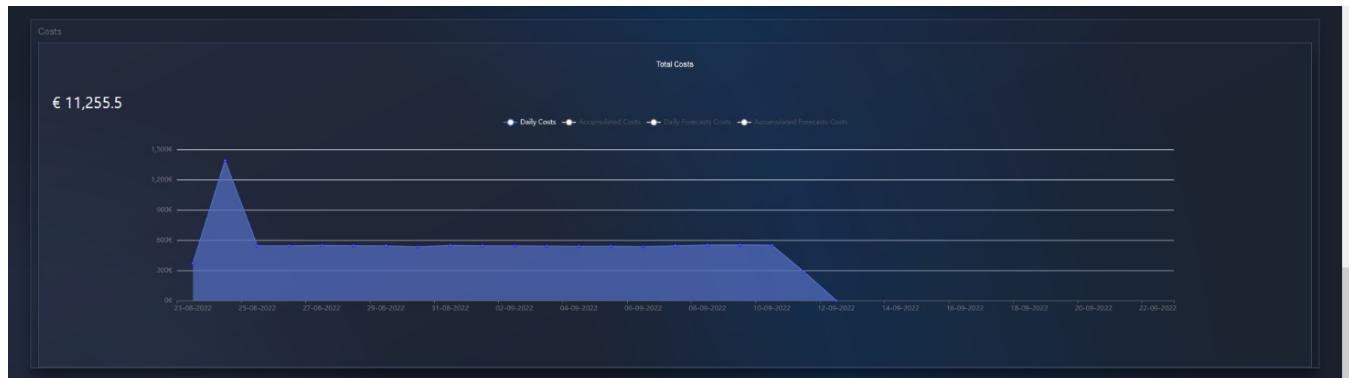

Figura 110 – Dashboard section "Costs"

Figura 111 – Dashboard section "Security"

6 Inventory

The inventory functionality collects metadata of installed assets across all providers present on the SCMP.

The assets currently present are:

- Virtual Machine
- Data Stores
- Networks
- Clusters
- Edge
- Security
- Others

Heterogeneous metadata, coming from different sources, is then normalized by the SCMP to allow for standard visualization.

Inventory is accessible from the “Inventory” menu item.

Figura 112 – Accesso a Inventory

6.0.1 Inventory Dashboard

The Dashboard page provides a global and aggregated view of all resources, while the menus above the breadcrumb path allow filtering by resource type. The functionalities available on the various pages are identical.

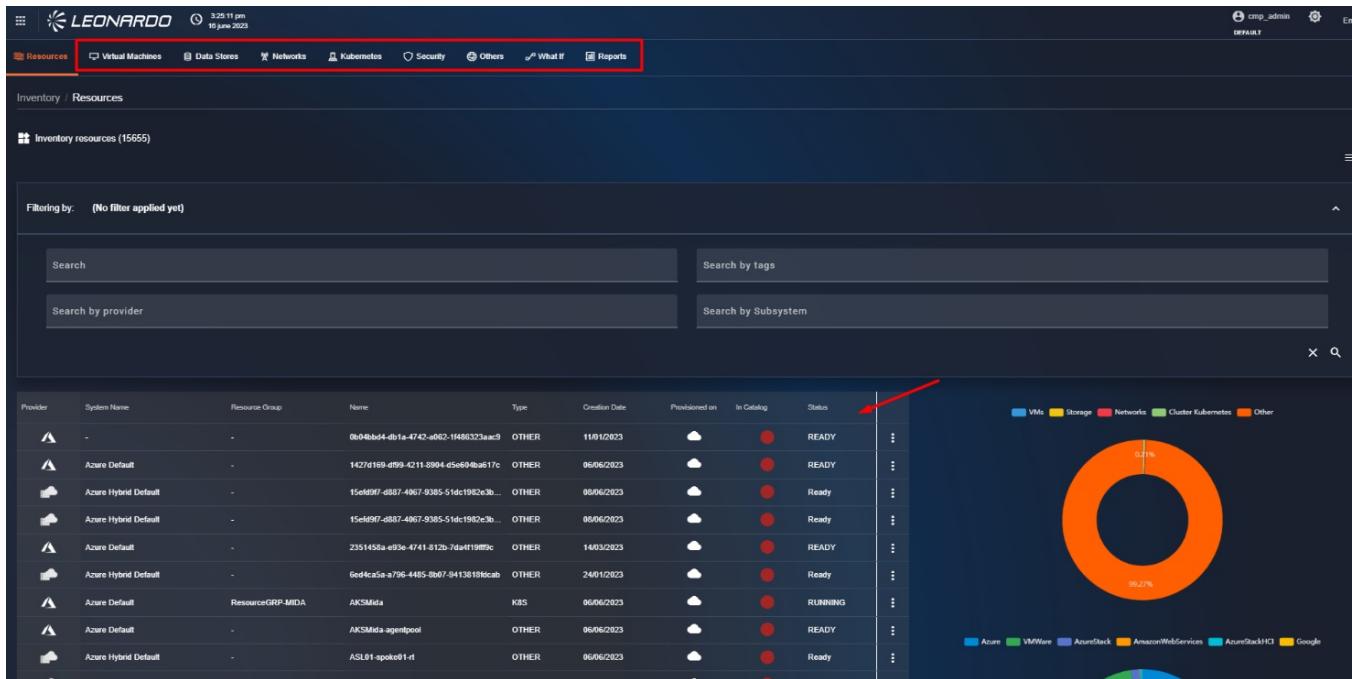

Figura 113 – dashboard di inventario

Within the “Resources” tab page, there are filters; in the first filter at the top, it is possible to search for resources by name, resource group, Provider, etc. It is also possible to filter resources by “Provider” and “Subsystem”.

The last filter allows searching by tag. Click on it and select a tag, then by clicking the button depicting a magnifying glass, the page will refresh and display the list of filtered resources.

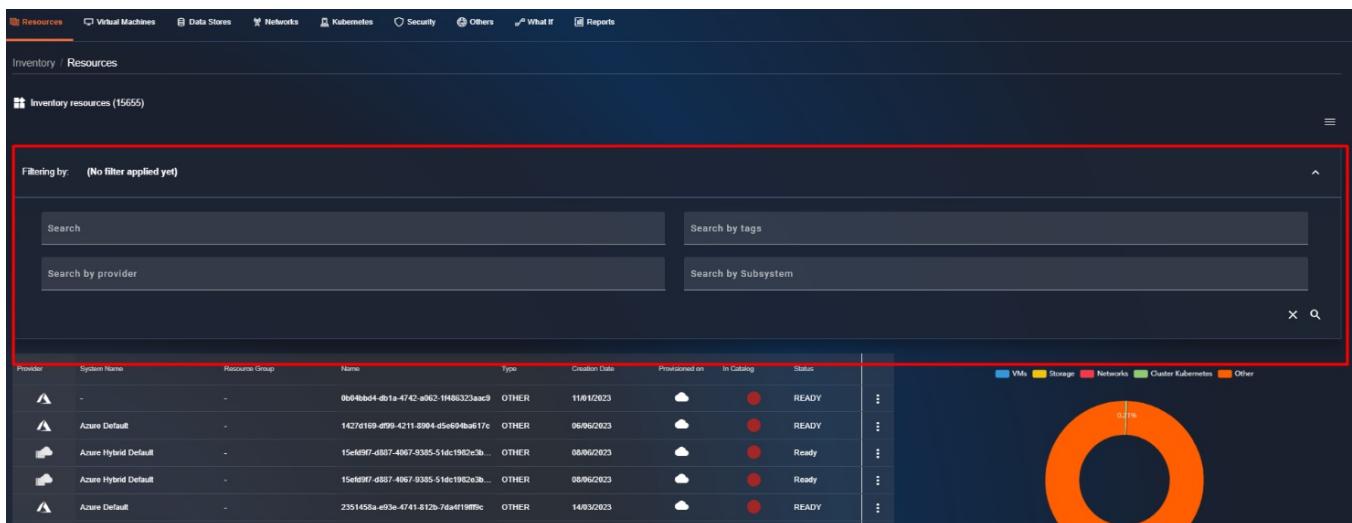

Figura 114 – Ricerca generica, per tag, per Provider e Subsystem

It is also possible to click on the graphs to automatically apply the relevant filters.

6.0.1.1 Resource detail view

To view the details of a resource, you can click as shown in the figure:

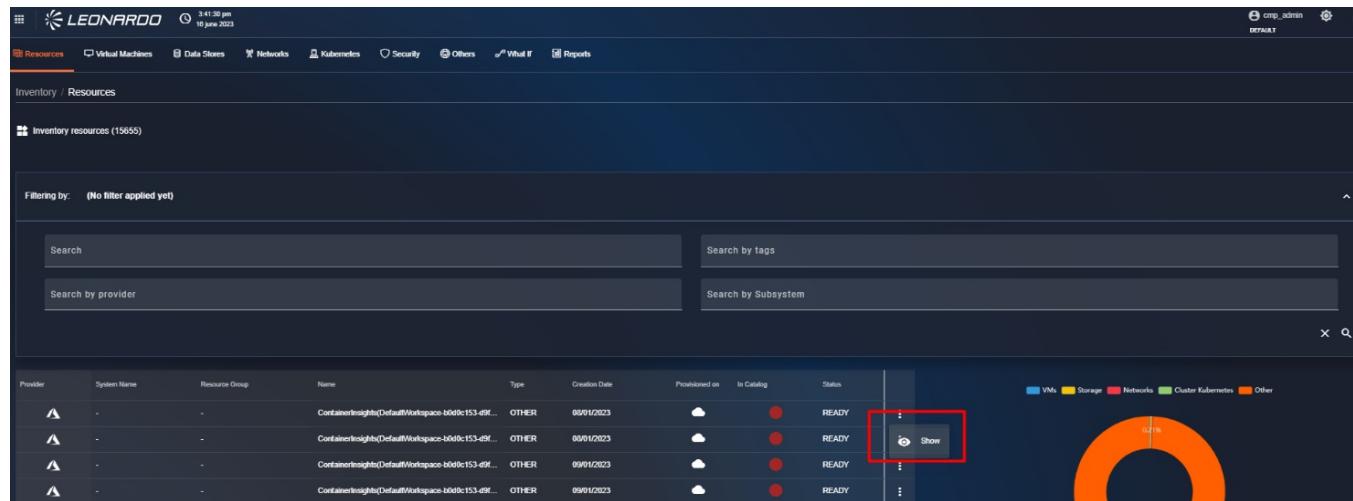

Figura 115 – Accesso alla risorsa in modalità lettura

The detail of an inventory asset shows the main characteristics at the top, such as monthly cost, machine size, and an external link to the resource pointing to the reference provider.

Below is the detailed view of a VM:

 Below this is a 'Networking' section with an interface named 'Test21-asic'. It lists:

- Public IP Address:** -
- Private IP Address:** 172.16.0.12
- IP Version:** IPv4
- State:** Succeeded

 To the right, under 'Details', are the following settings:

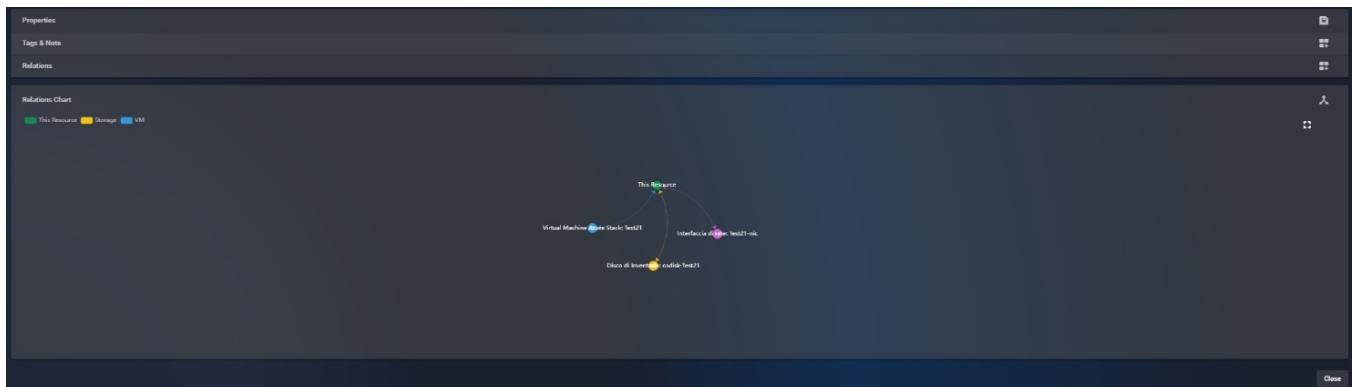

- Monthly Cost:** 5.00
- Name:** Test21
- OS Type:** Linux
- Category:** Standard_F4s_v2

 A 'Disks' section shows a single disk named 'Disk endisk-Test21' with the following parameters:

- Size (GB):** 30
- IOPS:** 500
- Throughput:** -
- State:** ATTACHED

Figura 116 – Dettaglio risorsa

And at the bottom, the asset's relationships with other SCMP elements, as shown in the figure:

*Figura 117 – Grafico delle relazioni*

The relationship graph allows navigating between resources by directly clicking on the circle of the linked resource, in order to land on its details.

Furthermore, it is possible to edit some attributes, such as tags, as shown in the figure:

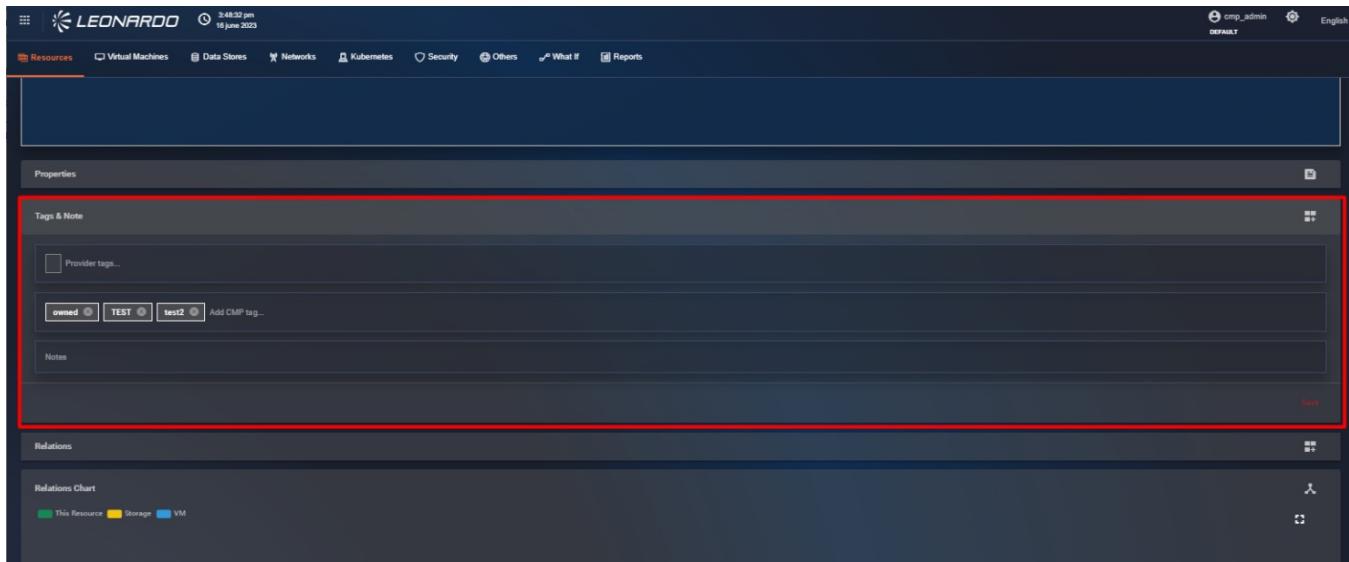

Figura 118 – Selezione del tag

For the “Provider Tags...” field, it is not possible to select a tag, as tags in this section are retrieved directly from the subsystem.

The “Add SCMP Tag...” field allows selecting from a list or manually entering one. Inside the tag, there is an “X” symbol to delete it.

It is possible to add multiple tags to the resource.

Subsequently, in the bottom right of the “Tags & Note” section, click on the “Save” button to save the change, and a banner will appear at the bottom indicating the tag has been saved.

Scroll the page to the bottom, and click on the “Close” button located on the right to return to the “Dashboard” tab page.

6.0.1.2 Actions on inventory machines

For inventory machines from supported providers, a new button available in the table context menu called “Manage” can be used to perform basic operations on the machines.

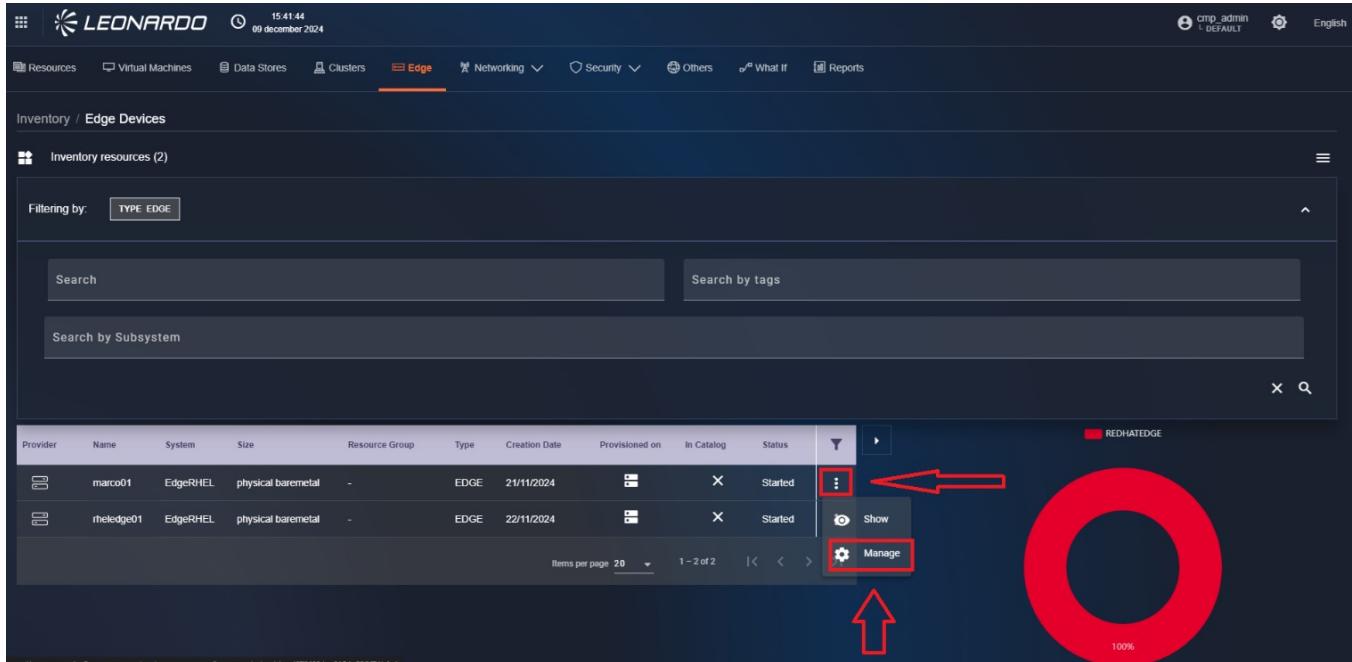

Figura 119 – Accesso alla funzionalità di "management"

From this resource detail page, the following operations can be performed using the menu at the top of the page; the operations available on the machines may vary depending on the provider:

Azure Stack HCI

- Start machine
- Stop machine
- Resize machine
- Add storage disks
- Add network interface
- Delete resource
- Remove disk from resource
- Remove network interface

Red Hat Edge

- Update an EDGE device image

Operations are indicated in white when they can be executed and in gray when they are not supported or unavailable for the resource.

The screenshot shows the 'Manage Virtual Machine di Inventory' page. At the top, there's a toolbar with icons for Start, Stop, Resize, Attach Disk, Attach Network Interface, Remove, Remove Attached Disk, Remove Attached Network Interface, and a 'vmware' provider indicator. Below the toolbar, there are two main sections: 'Virtual Machine (v1.1)' on the left and 'Details' and 'Disks' on the right. The 'Virtual Machine' section contains fields for System (CMP), State (POWERED_OFF), Update Date (05/07/2023), Provider (VMWare), and Resource Link (https://10.129.5.31/ui/app/home). The 'Details' section lists Monthly Cost (0.00), Name (DNS-Server01), OS Type (-), and Category (vm-4019). The 'Disks' section shows one disk entry: Disk CMP_01 with State ATTACHED.

Figura 120 – Operazioni sulle macchine di inventario

6.0.1.3 “Cluster Explorer” functionality

Cluster Explorer is a powerful feature that allows users to view namespaces within a cluster in detail. This function provides a comprehensive overview of data and resource organization within the cluster, facilitating navigation and management of complex environments.

With Cluster Explorer, users can:

- View the complete list of namespaces in a cluster: Get a quick overview of all available namespaces in the cluster.
- Examine the details of each namespace: Access complete information about each namespace, including name, description, labels, and resource quotas.
- Filter and search namespaces: Quickly find specific namespaces using advanced filtering and search criteria.

To access the functionality, select the “Clusters” item from the horizontal menu of the Inventory module.

Figura 121 – Accesso alla funzionalità di cluster explorer

Inside the page, a list of clusters present within the subsystems configured in the system will be displayed. Clicking on one of them will open a modal with the general details of the cluster.

Figura 122 – Finestra di dettaglio del cluster

We can notice that at the bottom right there is a “cluster explorer” button; pressing it will redirect us to the cluster Dashboard. This page can also be accessed using the “cluster explorer” button available in the “three dots” context menu present for each cluster in the list of results.

Within this page, we can view a graph representing the distribution of namespaces within the cluster; on the right, the legend of namespaces with the number of active pods is displayed.

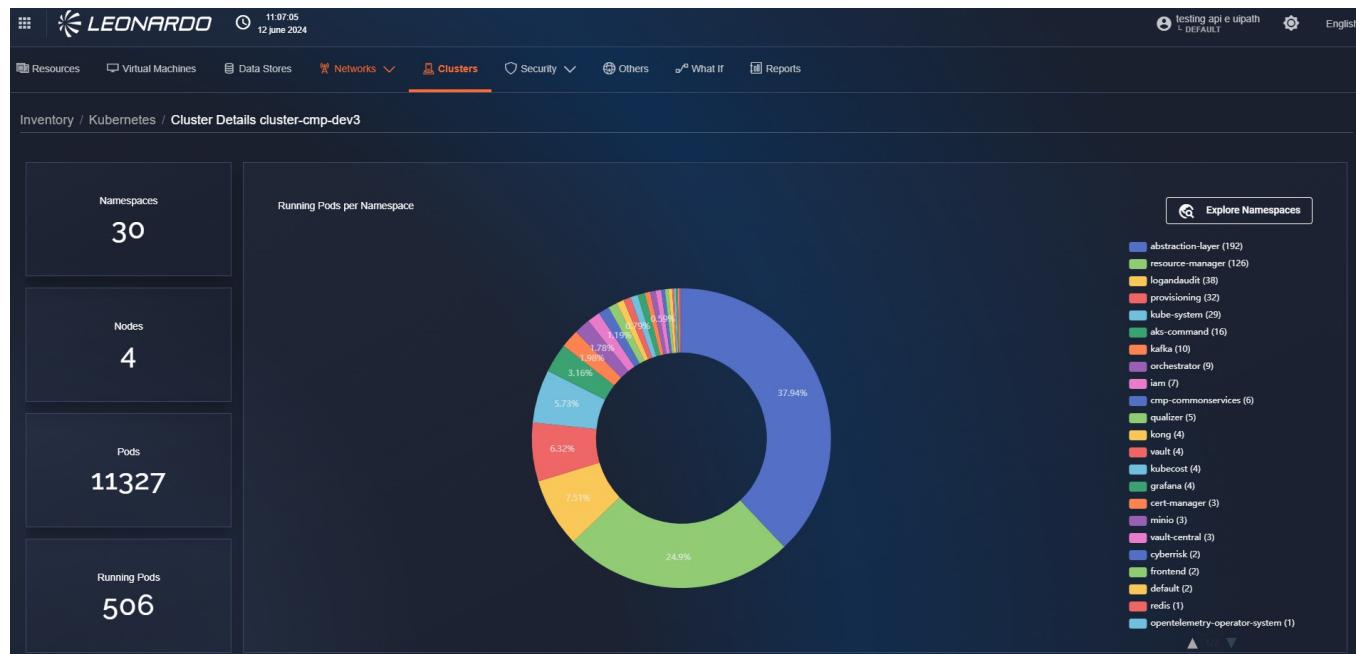

Figura 123 – Dashboard del “cluster explorer”

We can drill down into the details of namespaces using different components on the page:

it is possible to click on the “Explore namespaces” button at the top right or click on the number of namespaces displayed at the top left to view the namespace exploration page without filters. If we want to directly view the details of a namespace present in the graph, it is possible to click on the corresponding slice, and the detail page will be automatically filtered for the selected namespace.

Secure Cloud Management Platform

Figura 124 – Pagina "Namespace explorer"

The namespaces field at the top allows searching among available clusters by entering free text. If a match is found, you can select the namespace from the list to view its details.

Figura 125 – Dettaglio dei namespace

Using the “Down Arrow” commands, it will be possible to navigate between available categories and sub-categories of elements. Finally, by selecting a result, its details will be displayed in the right section of the page, which will be automatically populated with the selected result from the left.

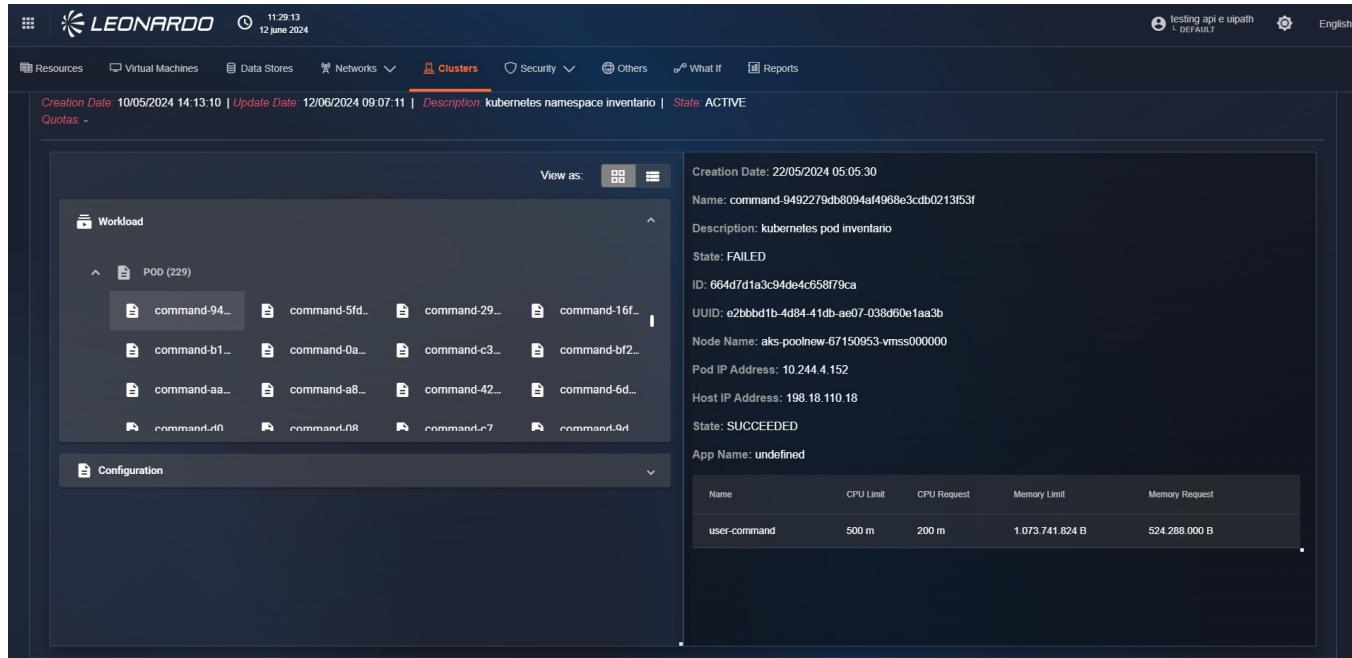

Figura 126 – Dettagli del contenuto del namespace

6.0.2 “WHAT IF” Functionality

This functionality allows performing simulations for asset migration from one provider to another, or within the same provider, in order to compare management and maintenance costs.

To run a simulation, click on the tab above the breadcrumb path that depicts a relationship connecting two entities, named ‘What If’.

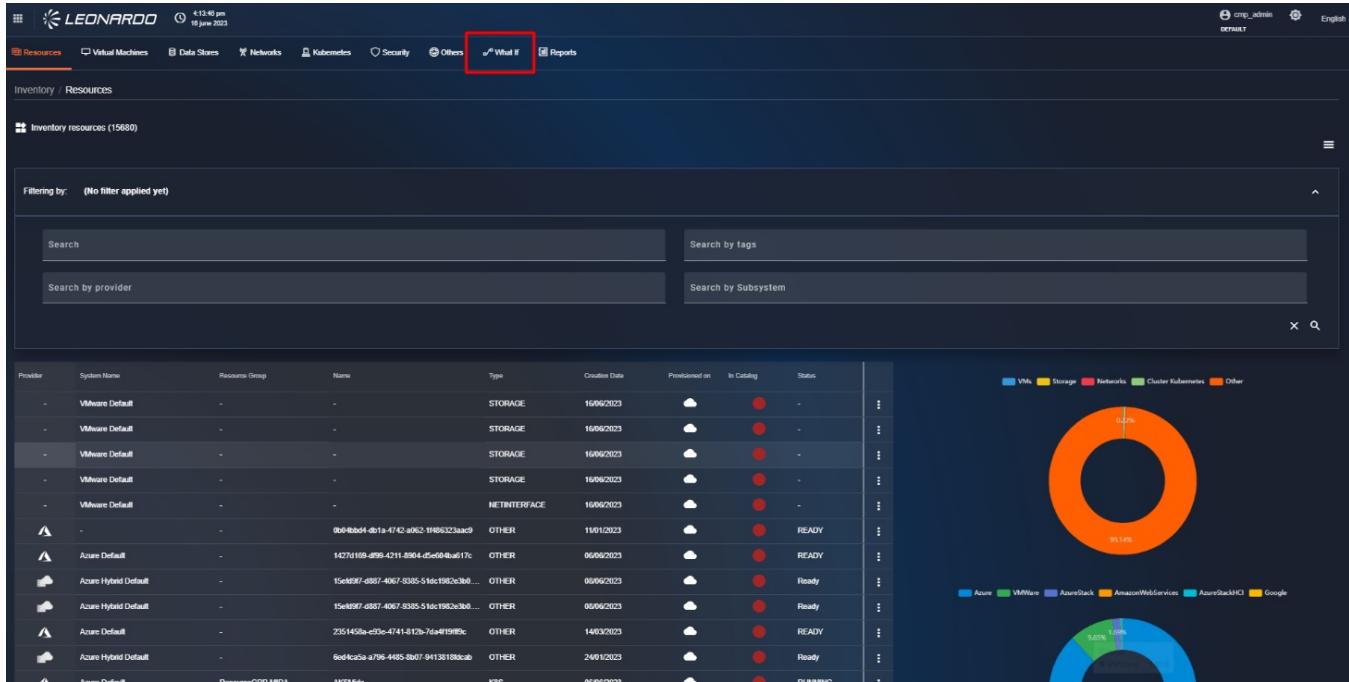

Figura 127 – Accesso a “What If”

After doing so, you will find yourself on the “What If” tab page.

Above the list of simulations, on the right, we can notice two tabs that allow filtering the list by simulation type, specifically:

upon opening the page, all “Change Provider” type simulations will be displayed, while clicking on the “Capacity” tab will allow viewing the list of “Change size” type simulations.

Figura 129 – Accesso alla funzionalità "What If: Migrate Provider"

After doing so, the user will find themselves on the “Start” page of step 1 for simulating resource migration from one cloud provider to another.

On the left, in the “Select Resources to migrate” box, the user can search for resources using three types of filters, including:

- “Search” which allows searching for a resource by name;
- “Search by Type” to obtain resources by selecting the resource type;
- “Search by tags” which allows searching for resources using one or more tags.

Within the resource table, only resources that have a relationship in the catalog will be displayed.

Within the resource table, click on one of them and, using the “drag and drop” technique, drag it to the right, into the box titled “Currently selected”.

A maximum of three resources can be included per simulation.

Subsequently, in the bottom right, click on the “Next” button.

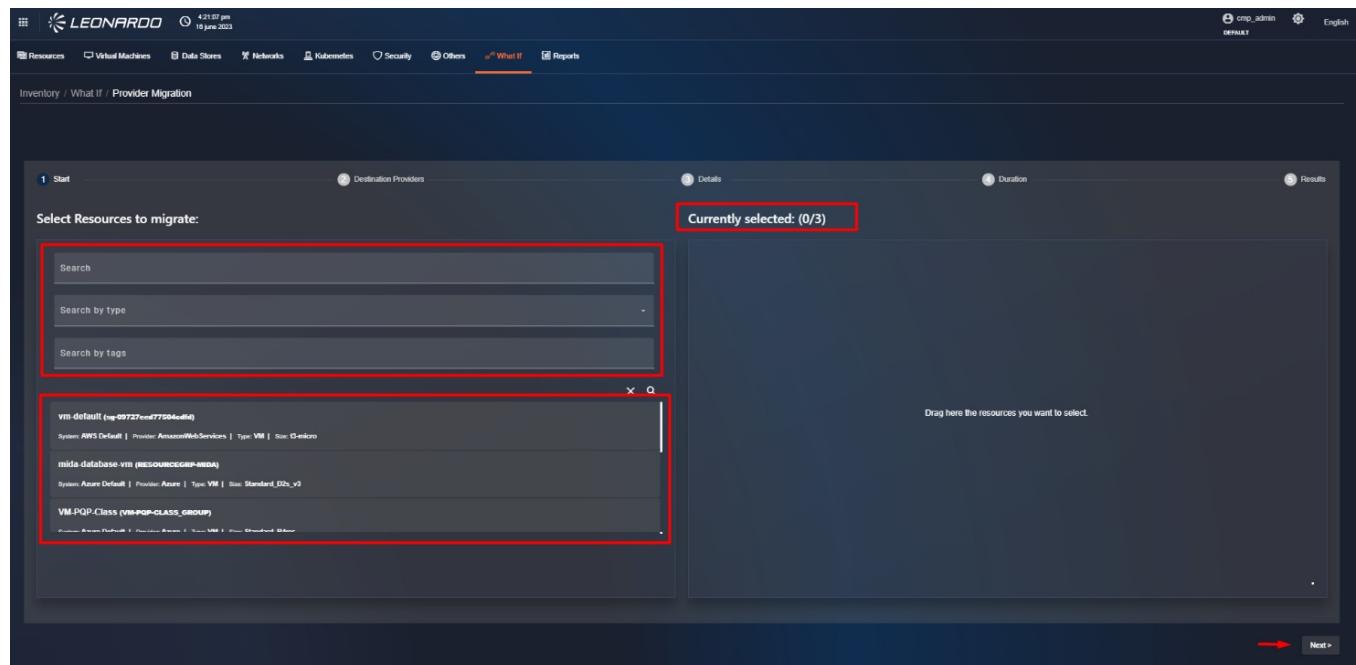

Figura 130 – Scelta delle risorse in cui effettuare la

migrazione del provider

After doing so, the user will find themselves on the “Destination Providers” page of step 2, where it is possible to click on the checkbox corresponding to one or more providers. Based on the selected provider type, the value in the ‘Option selected’ field at the bottom left will be automatically populated with the names of the selected providers.

Subsequently, in the bottom right, click on the “Next” button, while to return to the “Start” page of step 1, click on the “Back” button.

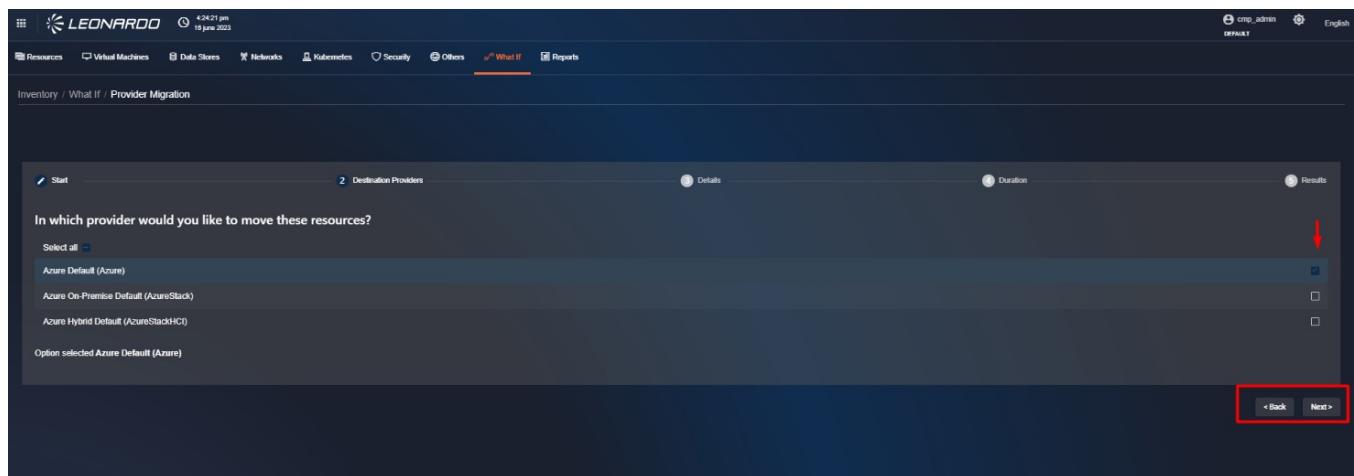

Figura 131 – Scelta del Cloud Provider in cui migrare le risorse

After clicking the “Next” button, the user will find themselves on the page of step 3 titled “Details”.

On this page, cards will be displayed, one for each subsystem selected in step 2.

In each card, on the left, there is a list of regions available for the cloud provider, and on the right, an empty section is displayed.

Selecting one or more regions in the right section (in red in the figure) will display a menu in the right section that allows selecting the type of cost to apply (in yellow in the figure). Selecting the “Consumption” type requires no further parameters, while selecting the “Reservation” type, to the left of the field, it will be possible to choose the Reservation period (in yellow in the figure).

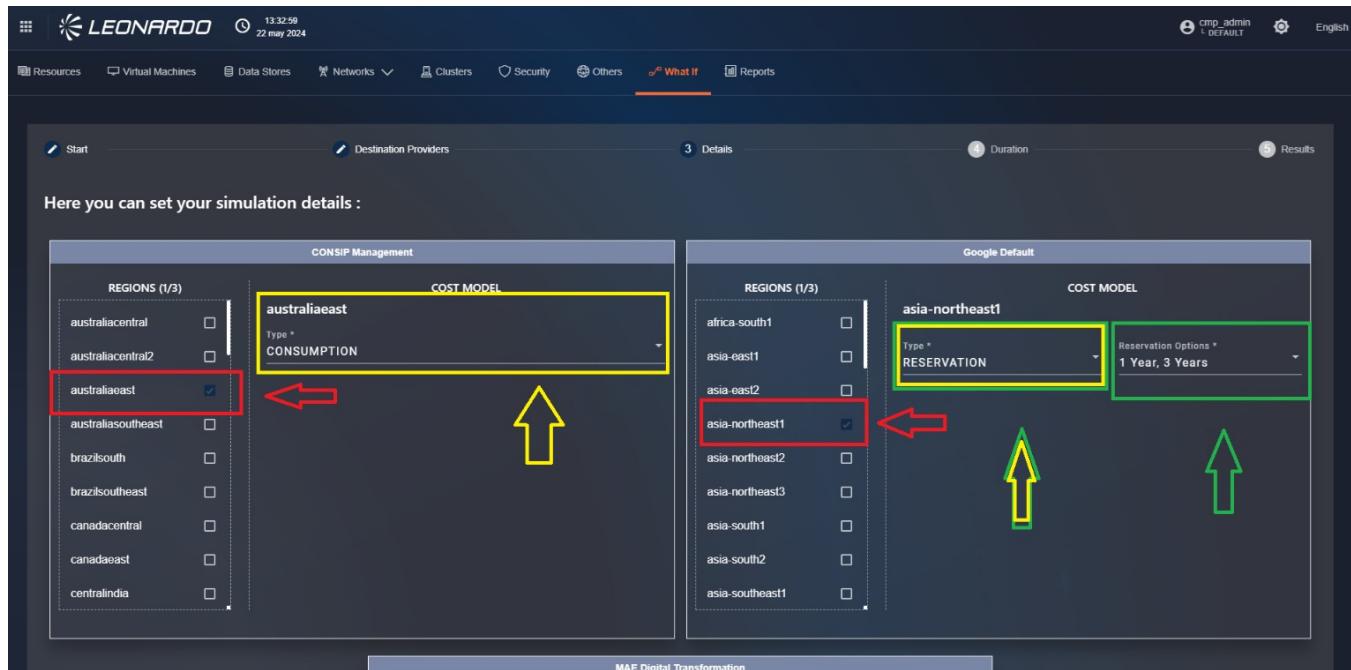

Figura 132 – Selezione della "Regione" e del "Cost Model"

After clicking the “Next” button, the user will find themselves in step 4 titled “Duration”.

From the “Duration” page of step 4, select an interval for the simulation among:

- “One Month”
- “Six Months”
- “One Year”

To return to the “Details” page, in the bottom right, click on the “Back” button. Instead, to proceed with the simulation, click on the “Launch Simulation” button.

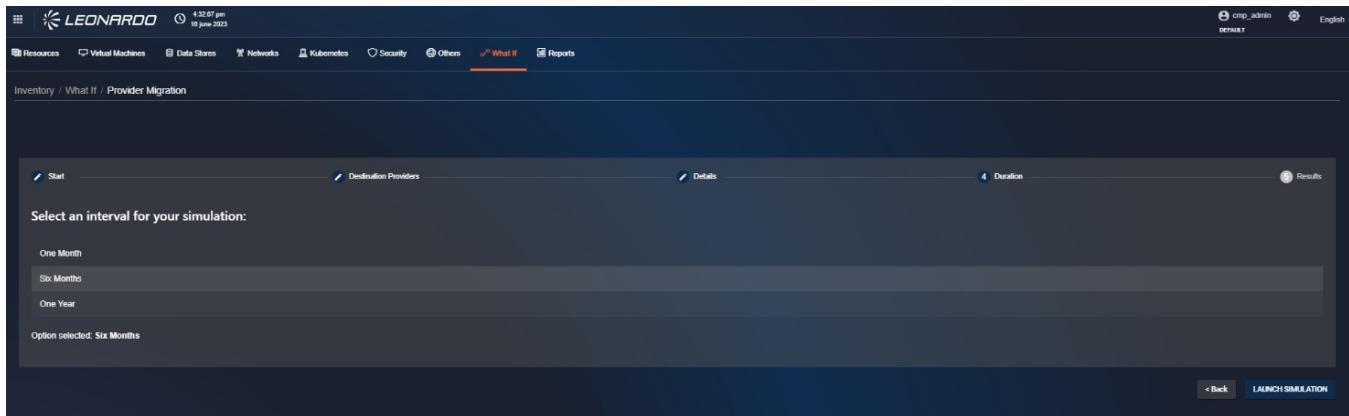

Figura 133 – Selezione dell'intervallo di tempo

After clicking the “Launch Simulation” button, the user will find themselves on the “Results” page of step 5.

Within the “Results” page, at the top, the “Simulation parameters” box can be viewed, which contains a summary of the parameters used. (in yellow in the figure)

Below the “Summary” box, there are different sections, one for each destination provider (in red in the figure), and inside, we can view the list of resources that can be migrated to the provider (in green in the figure). Clicking on one of them will display a histogram graph. In this graph we can note:

- A line parallel to the X-axis indicating the current cost of the resource.
- A series of bars (one for each region and selected cost type) that will be red when the destination price is higher than the starting price or green when the price is lower than the current cost of the resource; hovering over one of them will display its reference.
- A summary table of the selected cost types, which is used to generate the bar chart.

It is possible to view details for other simulations (in purple in the figure) using the procedure just described.

To exit the simulation without saving, in the bottom right, click on the “Close” button.

To save the simulation, click on the “Save” button next to the “Close” button, and then click on “Confirm”.

After clicking a button, the user is redirected to the “What If” tab page.

6.0.2.2 Scenario “What If”: Change Resource Capacity

This functionality allows comparing the costs of a resource in case of modification of its technical characteristics.

Still from the “What If” tab page, in the top right, click on the “Change resources capacity” box.

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there's a navigation bar with links for Resources, Virtual Machines, Data Stores, Networks, Kubernetes, Security, Others, What If, and Reports. The 'What If' link is highlighted in orange. Below the navigation, there are two main sections: 'Migrate to another provider' on the left and 'Change resources capacity' on the right, both enclosed in red boxes. A message "... or take a look to a previous simulation:" is centered between them. At the bottom, there's a table titled 'Filter simulations' with columns for Name, Creation Date, Destination Providers, Status, Export, and Options. The table lists five entries, all of which have a green status icon and are set to export to Google. The table includes pagination controls at the bottom right.

Name	Creation Date	Destination Providers	Status	Export	Options
Multiple Provider Migration	16/06/2023 16:39	Azure	●	▼	⋮
Multiple Provider Migration	16/06/2023 09:35	Azure	●	▼	⋮
Multiple Provider Migration	16/06/2023 09:33	Azure	●	▼	⋮

Multiple Provider Migration	06/06/2023 16:44	Google	●	▼	⋮

Figura 137 – Accesso alla funzionalità "What If: Change resources capacity"

After doing so, the user will find themselves on the “Start” page of step 1.

On the left, in the “Select Resources to change” box, the user can search for resources using three types of filters, including:

- “Search” which allows searching for a resource by name;
- “Search by Type” which allows obtaining resources by selecting the resource type;
- “Search by tags” which allows searching for resources using one or more tags associated with them.

The resource table will only show resources that, within the SCMP catalog, have more than one “Relationship” with different sizes but belong to the same region, price type, and operating system.

In the bottom left, there is the resource table, which can be filtered based on the parameters entered in the filter(s). Within the resource table, click on one of them and, using the “drag and drop” technique, drag it to the right, into the box titled “Currently selected:”.

A maximum of three resources can be included per simulation.

Subsequently, in the bottom right, click on the “Next” button.

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there's a navigation bar with tabs like 'Resources', 'Virtual Machines', 'Data Stores', 'Networks', 'Kubernetes', 'Security', 'Others', 'What If' (which is highlighted in orange), and 'Reports'. Below the navigation is a breadcrumb trail: 'Inventory / What If / Resource Change'. The main area is divided into sections: 'Start' (step 1), 'Resource Provider' (step 2), 'Duration', and 'Results'. On the left, there's a search bar and a dropdown menu listing resources: 'vm default (rg-09727end7752med4)', 'mida-database vm_DataDisk_0 (RESOURCESGRP-MIDA)', and 'sonarqube_idx_DataDisk_0 (RESOURCEGRP-MIDA)'. On the right, there's a large text input field with placeholder text 'Drag here the resources you want to select.' and a 'Next >' button at the bottom right.

Figura 138 – Selezione delle risorse da cui modificare le capacità

After doing so, the user will find themselves on the “Resource Provider” page of step 2, where it is possible to modify the size of one or more resources.

Within the “Resource Provider” page of step 2, for a resource, click on the dropdown menu in the “Size” column and select a different size from the initial one.

After that, in the bottom right, click on the “Next” button to continue the simulation.

To return to the “Start” page of step 1, click on the “Back” button.

The screenshot shows the 'Resource Provider' interface for step 2. It has a header with 'Start' (step 1), 'Resource Provider' (step 2), 'Duration', and 'Results'. Below the header is a table titled 'Select Resource' with columns 'ID', 'UUID', and 'Size'. There is one row listed: '63u581068776951972536a' with 'Standard_D1_v2' in the 'Size' column. At the bottom right of the table, there are buttons for 'Items per page' (set to 5), '1 - 1 of 1', and '< Back' and 'Next >'.

Figura 139 – Modifica della size di una risorsa

After clicking the “Next” button, the user will find themselves on the “Duration” page of step 3.

Within the aforementioned page, it is necessary to select an interval for the simulation.

After that, in the bottom right, click on the “Launch Simulation” button.

To go back, click on the “Back” button; in this way, the user will find themselves on the “Resource Provider” page of step 2.

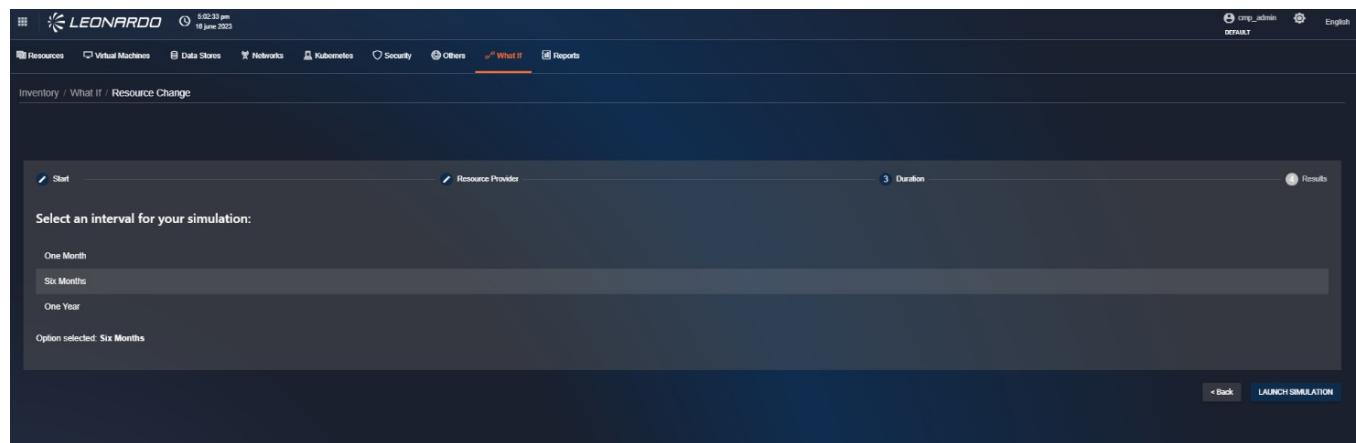

Figura 140 – Selezione dell'intervallo per la simulazione

After clicking the “Launch Simulation” button, the user will find themselves on the “Results” page of step 4.

Within the “Results” page, at the top, there is a “Summary” box that advises whether to modify the size of the resources. Below, there is an histogram graph, where the purple bar represents current costs, while the green bar represents target costs.

To save the simulation, click on the “Save” button next to the “Close” button, and then click on “Confirm”. After doing so, the user is redirected to the “What If” page.

To exit the simulation without saving it, in the bottom right, click on the “Close” button. After doing so, the user will find themselves on the “What If” page.

Secure Cloud Management Platform

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there's a header bar with the Leonardo logo, the date (18 June 2023), and time (5:18:44 pm). Below the header is a navigation bar with links: Resources, Virtual Machines, Data Stores, Networks, Kubernetes, Security, Others, What If (which is underlined in orange), and Reports. The main content area has a breadcrumb navigation path: Inventory / What If / Provider Migration. On the left, there's a sidebar with two tabs: 'Start' (with a checked checkbox) and 'Destination Providers' (also with a checked checkbox). The 'Start' tab is currently active. Under the 'Simulation parameters:' section, the following details are listed:

- Resources: vm-default (AmazonWebServices)mida-database-vm (Azure)
- Destination Providers: Azure Default (Azure)
- Destination Providers Region: uaecentral
- Destination Providers Costs: CONSUMPTION
- Duration: One Year

Below this, there's a table with one row, showing 'Azure Default' in the first column and a long GUID string in the second column.

Summary:

Moving these 2 resources to these providers you would lose -159.95% (-1549.15€) compared to the actual costs.
ADVICE: It's suggested to remain with actual provider.

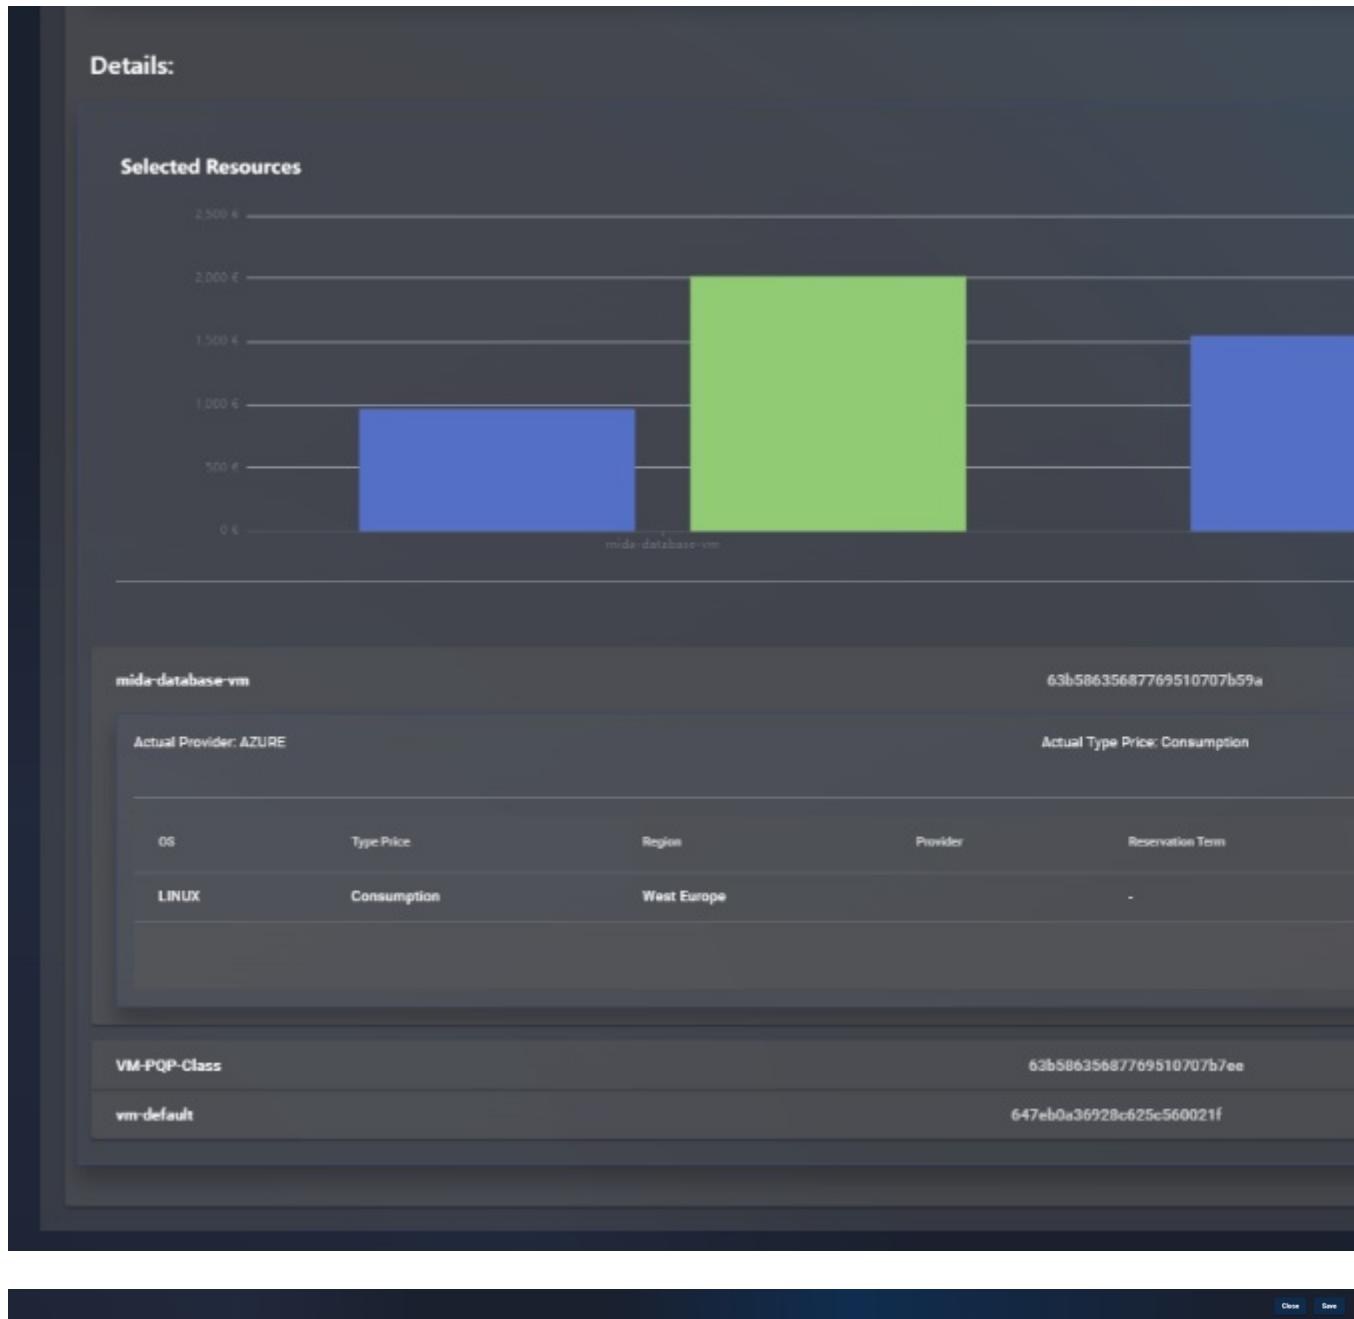

Figura 141 – Parametri di configurazione e consiglio sulla simulazione

6.0.2.3 What If scenario Export

For a simulation of a resource size modification, it is possible to export it in PDF, CSV, and JSON format.

Within the “What If” page, at the bottom, there is a table of simulations; click on the “Capacity” button located in the top right corner of the aforementioned table.

After doing so, the table shows simulations regarding resource size modification.

For a simulation, click on the button depicting an arrow.

At this point, a sub-menu will open where it is possible to export in the three previously described formats.

Name	Creation Date	Duration	Status	Export	Options
Resource Migration	16/06/2023 17:19	Six Months	Green	PDF	⋮
Resource Migration	14/06/2023 15:39	Six Months	Green	CSV	⋮

Figura 149 – Lista dei report effettuati

6.0.3.2.1 Report Scheduling

If, instead, you want to schedule automatic report execution, it will be necessary to select “Recurring” for the “Report Type” field. In this case, the window refreshes to show additional parameters for configuring the periodic report.

The parameters to enter are:

- Period: allows selecting the report sending frequency (hourly, daily, ...).
- “Receive only if not empty” if selected, the file will not be sent when it contains no information.
- Report Language: allows selecting the language used in the report.
- File format: allows selecting one or more file types to include in the email.
- User E-mails: allows entering an email address to send reports to. After entering an email, it is necessary to press “Enter” on the keyboard to confirm its insertion. Once pressed, the newly entered email will move to the box at the bottom, and the field will be cleared to allow the insertion of a new email, if necessary.

Secure Cloud Management Platform

The screenshot shows the 'Costs' report configuration dialog. It includes fields for 'Report Type' (One-Shot or Recurring), 'Period' (e.g., Last 7 days, Last 30 days, Last Year), 'Report's language' (Italian), 'File format' (Costs Details - Group By Resource), and 'User E-mails' (FmOps Report). A note at the bottom says 'Press ENTER for each email you want to confirm and add to the list of recipients. It's possible to add multiple emails.' A 'Submit' button is visible at the bottom right.

Figura 150 – Parametri dei report schedulati

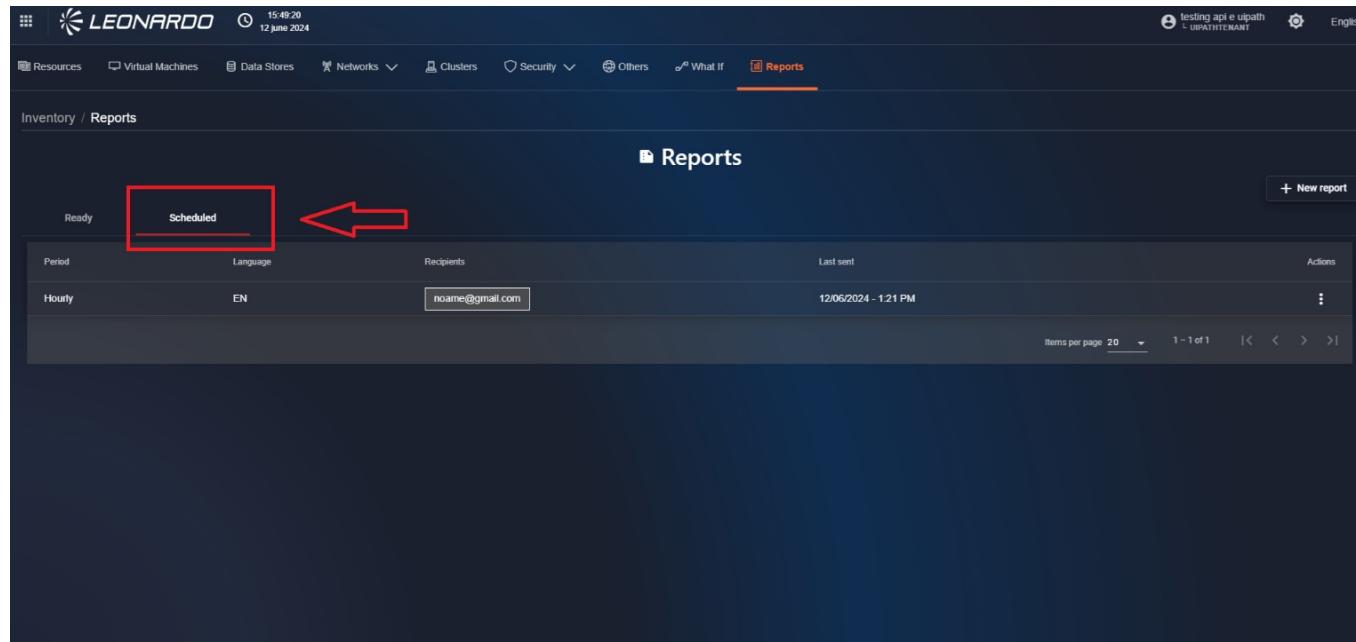

Having configured all parameters, the “Submit” button will become clickable. Click it to confirm the insertion, and after a loading period, the newly generated report will be visible in the list.

Figura 151 – Lista dei report effettuati

6.0.3.2.2 List of scheduled reports

To view the list of scheduled reports, select the “Scheduled” tab at the top left of the reports page.

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there is a navigation bar with various tabs: Resources, Virtual Machines, Data Stores, Networks, Clusters, Security, Others, What If, and Reports. The Reports tab is highlighted with a red underline. Below the navigation bar, the title "Inventory / Reports" is displayed. Underneath, there is a sub-section titled "Reports". On the left side of this sub-section, there are two tabs: "Ready" and "Scheduled". The "Scheduled" tab is highlighted with a red box and has a red arrow pointing to it from the bottom-left. Below these tabs, there are filters for "Period" (set to "Hourly"), "Language" (set to "EN"), and "Recipients" (set to "noame@gmail.com"). To the right, there is a column for "Last sent" (showing "12/06/2024 - 1:21 PM") and an "Actions" column with a three-dot menu icon. At the bottom right of the sub-section, there are pagination controls and a "New report" button.

Figura 152 – Lista dei report schedulati

On this page, you will find the list and related information of scheduled reports present in the system. For each result, by clicking the “Three dots” button on the right, three operations can be performed:

- View the last generated report.
- Edit the schedule settings; it will not be possible to modify the selected providers or subsystems.
- Delete the schedule to stop sending emails.

Figura 153 – Modifica di una schedule

6.0.3.2.3 Using reports

By clicking on a static report row, or using the “Show report” button available for scheduled reports, it will be possible to view the detail page of the selected report.

Within the Inventory report summary, there is a “Stats” section showing the number of disks, interfaces, networks, and virtual machines belonging to the selected provider.

Below the “Stats” section, the filters used by the user to generate the report are present.

Below the filters, there is a summary table of resources belonging to the providers. On the right, there are two buttons: “PRINT” and “EXPORT”.

Clicking on the “PRINT” button, a print preview modal appears. To print the report, click on the “Print” button in the bottom right; at this point, the printing of the report will start.

Clicking on the “EXPORT” button, it is possible to export the report in “.csv”, “.json”, or “.pdf” format.

To return to the “Results” tab, in the bottom right, click on the “CLOSE” button or in the top left, click on the left-pointing arrow, next to the report title.

Google	CMPPROJECT-374610	1	1	1	0	0

Figura 154 – Dettagli dei report

7 Monitoring

The SCMP collects metrics from all cloud providers and aggregates them by macro categories.

This aggregation allows comparison between metrics from different providers.

By accessing the dashboard, we can see how this aggregation mechanism provides an overview of resource utilization, divided by provider and organized by associated resource type.

Within the functionality, it is possible to filter by resource type using the tab bar at the top, while for a general view, the dashboard can be used.

The monitoring module can be accessed via the dedicated menu. As shown in the figure:

Figura 155 – Access to the Monitoring Module

7.0.1 Monitoring Dashboard

At this point, the user will be on the "Dashboard" monitoring tab page.

Figura 156 – Monitoring Dashboard

7.0.1.1 Monitoring Section Filters

Within the page, a series of filters are available that can be selected simultaneously to filter the dashboard results.

The main filter is the display period, which can be found at the top right. Clicking on it will open a selection window (in yellow in the figure) where it will be possible to either enter a customized time range, using the "From" and "To" fields on the left, or select a "Smart" time range by directly clicking on the desired choice in the scrollable section on the right.

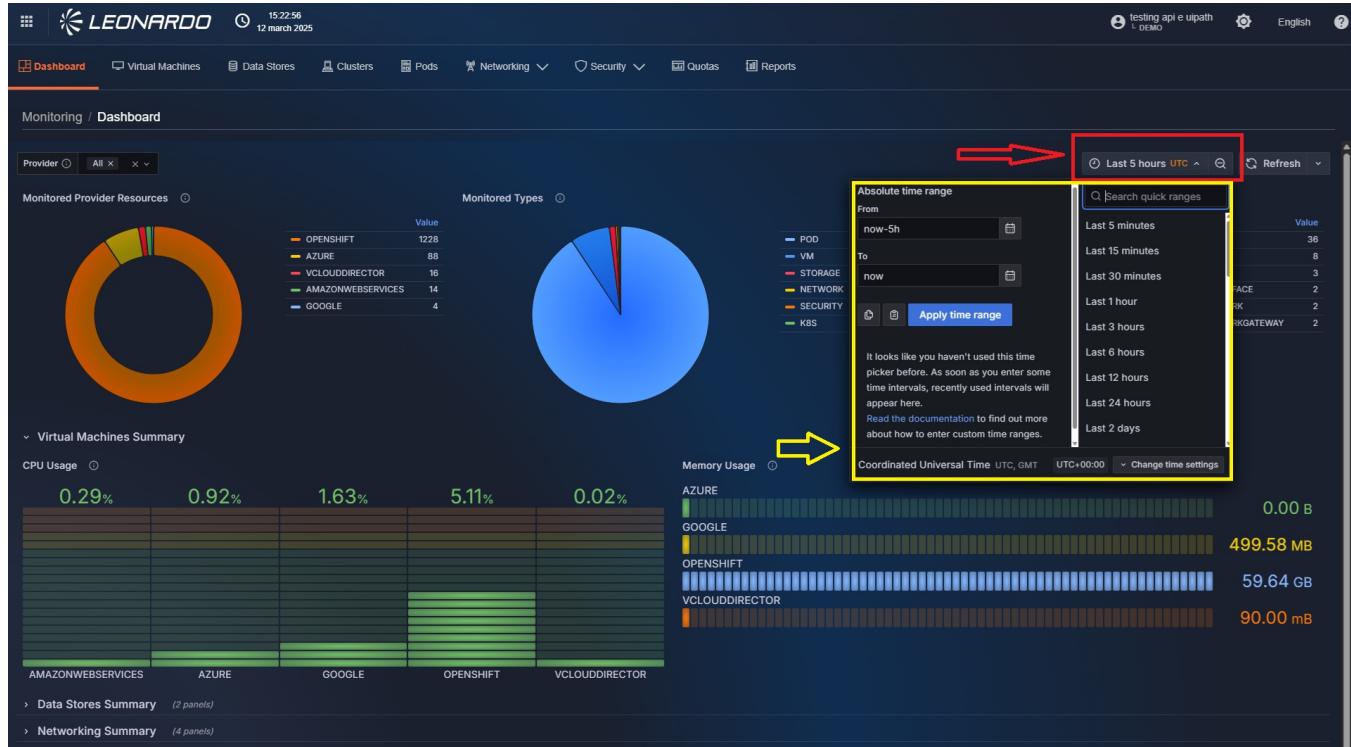

Figura 157 – Monitoring Time Filter

Additionally, a series of filters are available at the top left of the page, allowing users to filter the retrieved resources. Specifically, it is possible to filter by:

- Provider type
- Subsystem name.
- Resource name (only in detailed dashboards)

These filters allow for multiple values to be selected and can be combined to achieve the desired granularity.

Figura 158 – Monitoring Functionality Filters

7.0.2 Quotas Dashboard

The Quotas dashboard, available in the "Quotas" tab, allows viewing the details of consumption and related limits applied to Vcloud type subsystems.

To access it, you need to click the button at the top of the tab bar.

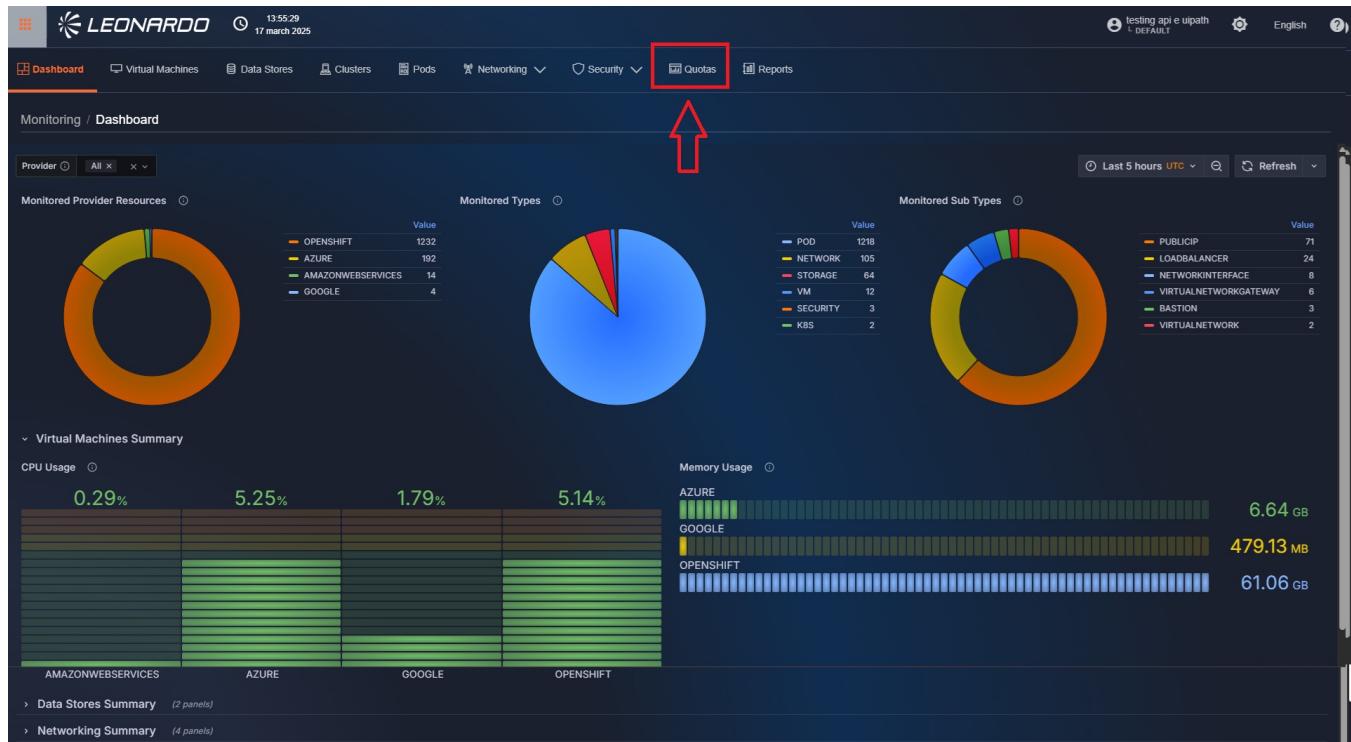

Figura 159 – Access to the Quotas section

At this point, the user will be on the "Quotas" monitoring tab page. At the top, we can see a filter bar, which allows filtering by provider or subsystem. Additionally, it is possible to view the filters for the chart using the "Show additional filters" button; these filters modify the chart's display. Below the filters, there is a table indicating the subsystem name and the quotas used, limits, and an average utilization divided by resource type. Finally, at the bottom, a time-based chart on the selected metric in the filters can be displayed.

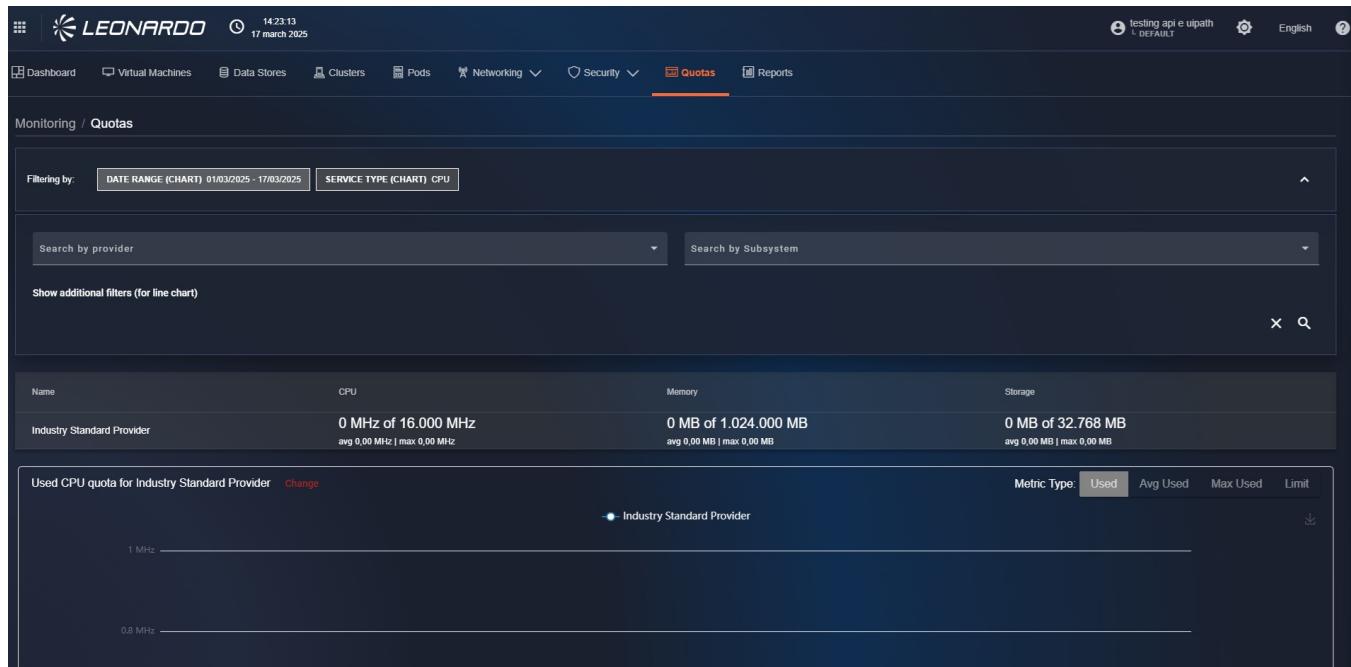

Figura 160 – Quotas Dashboard

7.0.3 Alarms on Quota Usage

To allow the user to receive notifications when quota usage thresholds are exceeded, an "Alerting" module has been included. To access it, you need to select the tab at the top of the Monitoring functionality.

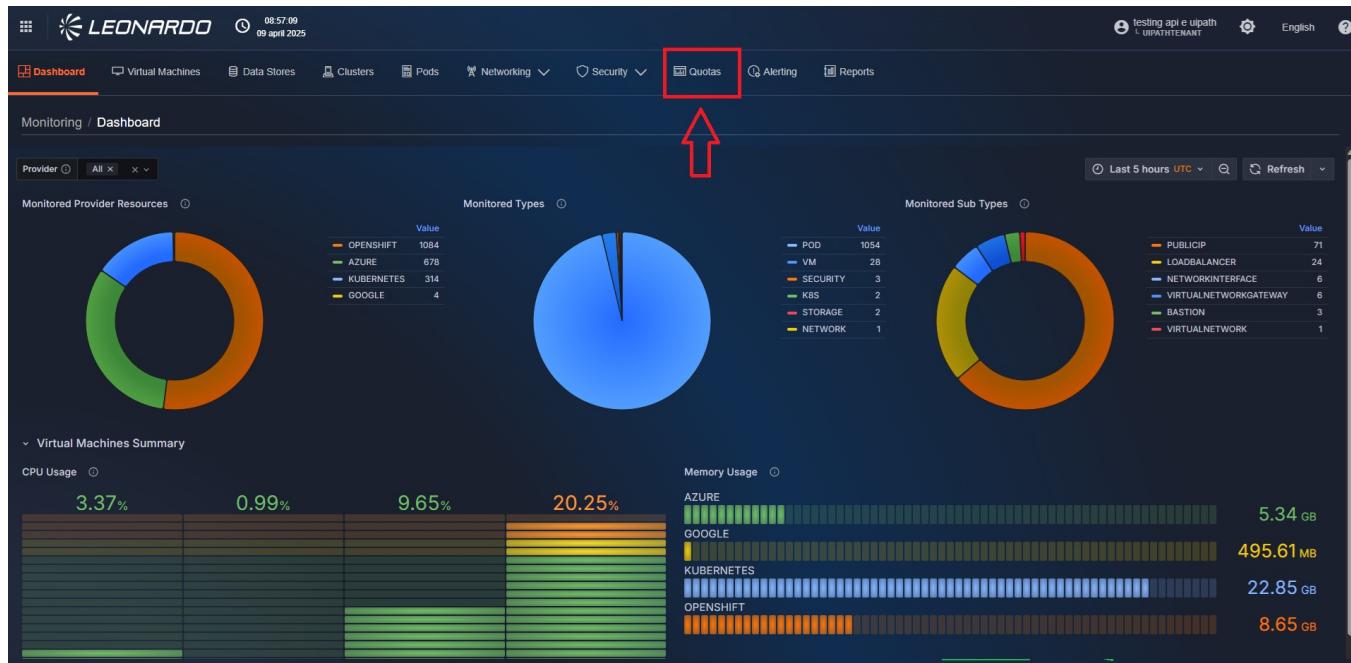

Figura 161 – Access to the Alerting system

Within the page, we find the list of "alerts" configured on the system, along with their respective configurations.

7.0.3.1 New Alert Creation

Using the menu available on the right, it is possible to add a new alert to the system. To do this, we select the displayed "New alert" option, and a configuration page will open.

Alert Schedule	Alert Type	Alert Send Type	Creation Date
Daily	Quota	Email	27/03/2025 16:45:00
Weekly	Quota	Email	04/04/2025 14:24:08

Figura 162 – New Alert Creation

On the configuration page, all fields must be filled in, specifically:

- **"Alert type"**: Select the alert type
- **"Alert schedule"**: Indicates the frequency of checks to be performed
- **"Quota type"**: Select the quota type to monitor
- **"Threshold (%)"**: Enter the percentage beyond which the alert will be sent.
- **"Subsystems"**: Select one or more subsystems to monitor
- **"Alert send type"**: Select the type of alert to receive, via e-Mail or Rabbit queue (for automatic integration with other systems)
- **"Alert format"**: Select the format of the sent file that defines the alert details.
- **"Emails"**: By selecting E-mail as the notification type, we can enter an email address to send reports to. After entering an email, it is necessary to press "Enter" on the keyboard to confirm its entry. Once pressed, the newly entered email will move to the box at the bottom, and the field will be cleared to allow for the entry of a new email, if necessary.

The screenshot shows the 'Alerting' section of the Leonardo Secure Cloud Management Platform. A new rule is being configured with the following parameters:

- Alert Type:** Quota
- Alert Schedule:** Daily
- Quota Type:** Memory
- Threshold (%):** 75
- Subsystems:** Industry Standard Provider
- Alert Send Type:** Email
- Alert Format:** CSV
- Emails:** (Input field for recipient emails)

Figura 163 – Configuration Page

7.0.3.2 Viewing, Modifying, and Deleting an Alert

On this page, we find the list and related information of the alerts present in the system. For each result, by clicking the "Three dots" button on the right, it will be possible to perform three operations:

- View the "alert" configuration
- Edit the alert settings.
- Delete the schedule to stop sending emails.

Alert Schedule	Alert Type	Alert Send Type	Creation Date	Actions
Daily	Quota	Email	27/03/2025 16:45:00	
Weekly	Quota	Email	04/04/2025 14:24:08	

Figura 164 – Alert Operations

7.0.4 Reporting Tools

The reporting functionality, specific to each feature, allows generating global reports of the information available for the various providers. Within the pages, the possibility will also be given to create files to facilitate information sharing. To access the functionality, above the breadcrumb path, click on the "Reports" tab.

Figura 167 – Report Configuration

At this point, the user can choose between two different actions:

- Create a static report that will be saved in the system.
- Schedule a job that generates the report periodically.

To confirm the creation of a static report, verify that "One-Shot" has been selected for the "Report type" field and click the "Submit" button at the bottom. After a loading period, the newly generated report will be visible in the list.

7.0.4.2.1 Report Scheduling

If, on the other hand, automatic report execution is desired, it will be necessary to select "Recurring" for the "Report Type" field. In this case, the window updates to show additional parameters for configuring the periodic report. The parameters to enter are:

- Period: allows selecting the report sending frequency (hourly, daily, ...).
- "Receive only if not empty": if selected, the file will not be sent when it contains no information.
- Report Language: allows selecting the language used in the report.
- File format: allows selecting one or more file types to include in the email.
- User E-mails: allows entering an email address to send reports to. After entering an email, it is necessary to press "Enter" on the keyboard to confirm its entry. Once pressed, the newly entered email will move to the box at the bottom, and the field will be cleared to allow for the entry of a new email, if necessary.

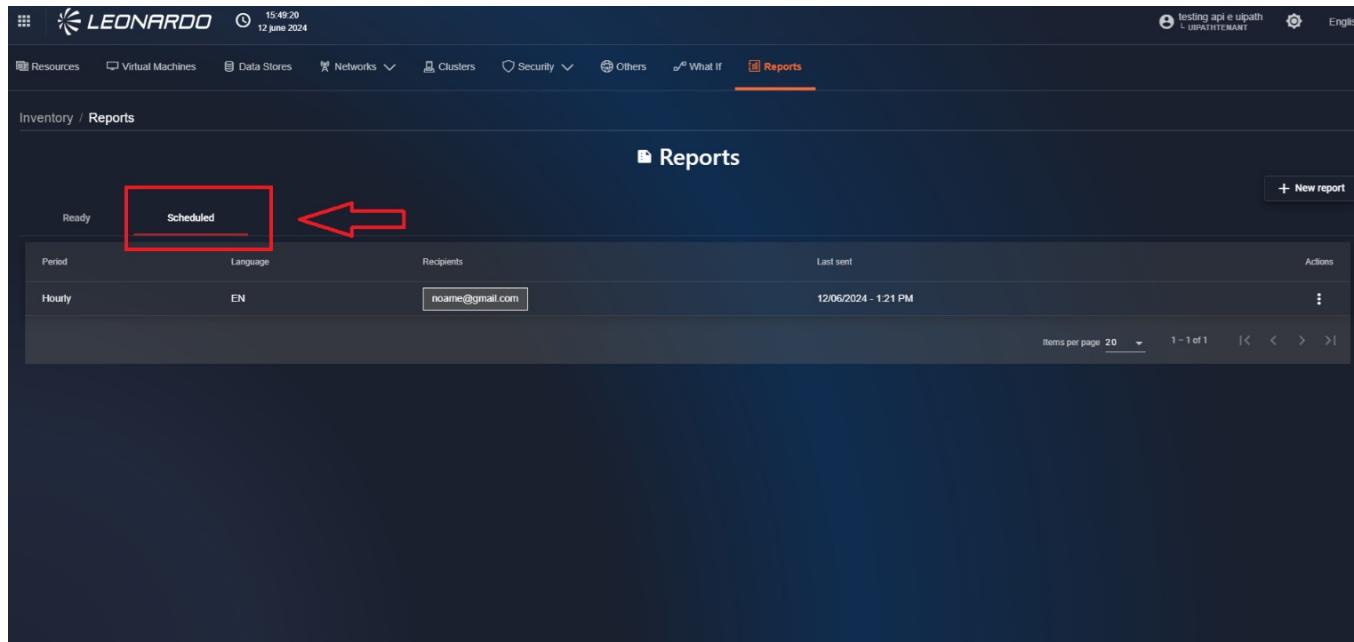

Figura 169 – Scheduled Report Parameters

Having configured all parameters, the "Submit" button will become clickable. Click it to confirm the entry, and after a loading period, the newly generated report will be visible in the list.

Figura 170 – List of Generated Reports

7.0.4.2.2 List of Scheduled Reports

To view the list of scheduled reports, select the "Scheduled" tab located at the top left of the reports page.

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there's a navigation bar with various tabs like 'Resources', 'Virtual Machines', 'Data Stores', 'Networks', 'Clusters', 'Security', 'Others', 'What If', and 'Reports'. The 'Reports' tab is currently selected, indicated by an orange underline. Below the navigation, there's a sub-menu for 'Inventory / Reports' with a 'Reports' icon. The main content area is titled 'Reports' and shows a table for scheduled reports. The table has columns for 'Period' (set to 'Hourly'), 'Language' (set to 'EN'), 'Recipients' (showing 'noame@gmail.com'), and 'Last sent' (showing '12/06/2024 - 1:21 PM'). On the far right of each row is a 'Actions' column with a three-dot menu icon. At the bottom of the table, there are pagination controls ('Items per page: 20', '1 - 1 of 1', and arrows for navigation).

Figura 171 – List of Scheduled Reports

On this page, we find the list and related information of the scheduled reports present in the system. For each result, by clicking the "Three dots" button on the right, it will be possible to perform three operations:

- View the last generated report.
- Edit the schedule settings; it will not be possible to modify the selected providers or subsystems.
- Delete the schedule to stop sending emails.

Figura 172 – Modify a schedule

7.0.4.2.3 Report Usage

By clicking on a static report row, or by using the "Show report" button available for scheduled reports, it will be possible to view the detail page of the selected report. Within the Inventory report summary, there is a "Stats" section which includes the number of disks, interfaces, networks, and virtual machines belonging to the selected provider. Below the "Stats" section, there are the filters used by the user to generate the report. Below the filters, there is a summary table of resources belonging to the providers. On the right, there are two buttons: "PRINT" and "EXPORT". Clicking the "PRINT" button will display a print preview modal. To print the report, click the "Print" button at the bottom right; at this point, the printing of the report will start. Clicking the "EXPORT" button allows exporting the report in ".csv", ".json", or ".pdf" format. To return to the "Results" tab, click the "CLOSE" button at the bottom right, or click the left-pointing arrow at the top left, next to the report title.

The screenshot shows the Leonardo SCMP interface. At the top, there's a navigation bar with links for Resources, Virtual Machines, Data Stores, Networks, Clusters, Security, Others, What If, and Reports. The Reports link is underlined, indicating it's the active section. Below the navigation is a breadcrumb trail: Inventory / Reports / Report 6669a0d3aae316468b3c8b34. The main content area is titled "Report Inventory Summary". It features a "Stats" section with five boxes: VMs (1), Disks (1), Networks (1), Interfaces (0), and K8Ss (0). Below this is a table titled "PROVIDER: AZURE,GOOGLE | SUBSYSTEM: MAE LAB,CMPPROJECT-374610". The table has columns for Type Provider, Subsystem Name, VMs, Disks, Networks, Interfaces, and K8Ss. It lists two entries: Azure (MAE LAB) with 14 VMs, 16 Disks, 14 Networks, 0 Interfaces, and 0 K8Ss; and Google (CMPPROJECT-374610) with 1 VM, 1 Disk, 1 Network, 0 Interfaces, and 0 K8Ss. At the bottom right of the table are buttons for "PRINT" and "EXPORT".

Figura 173 – Report Details

8 Security

The SCMP's security feature shows the vulnerabilities of inventory assets present on the SCMP.

To access the “Security” feature, click the bento button in the top left. After doing so, the menu bar will appear, where you need to click on “Security”.

Figura 174 – Access to Security

8.0.1 General Dashboard

At this point, the user is on the “Dashboard” tab page where the security data of resources for all configured providers are shown in an aggregated manner.

At the top, there is a filter bar that allows filtering results by subsystem, status, and/or policy name.

After that, the user notices the presence of the bar chart indicating the compliance status of resources assigned to policies, subdivided by subsystem.

By hovering the mouse over a section of the chart, we can see that the values displayed on the page are updated to show a preview of the detail.

It is possible to click on a section of the chart to automatically apply the “subsystem” and “status” filters to the page.

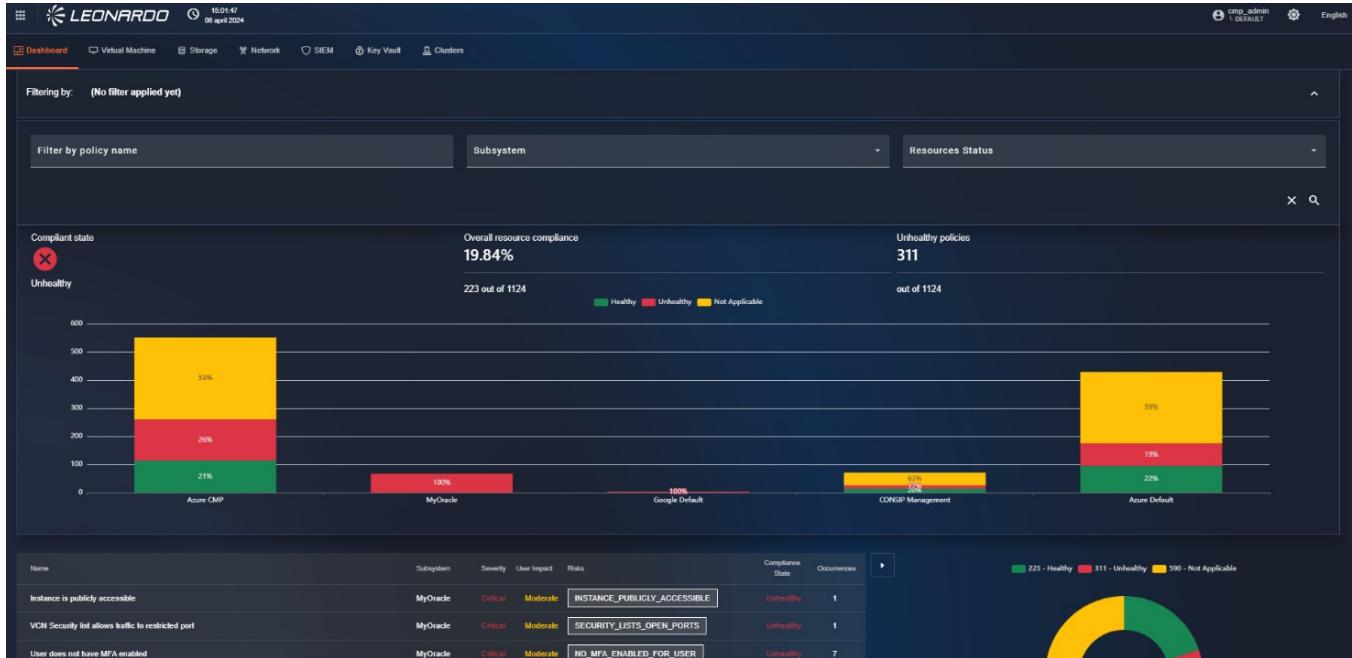

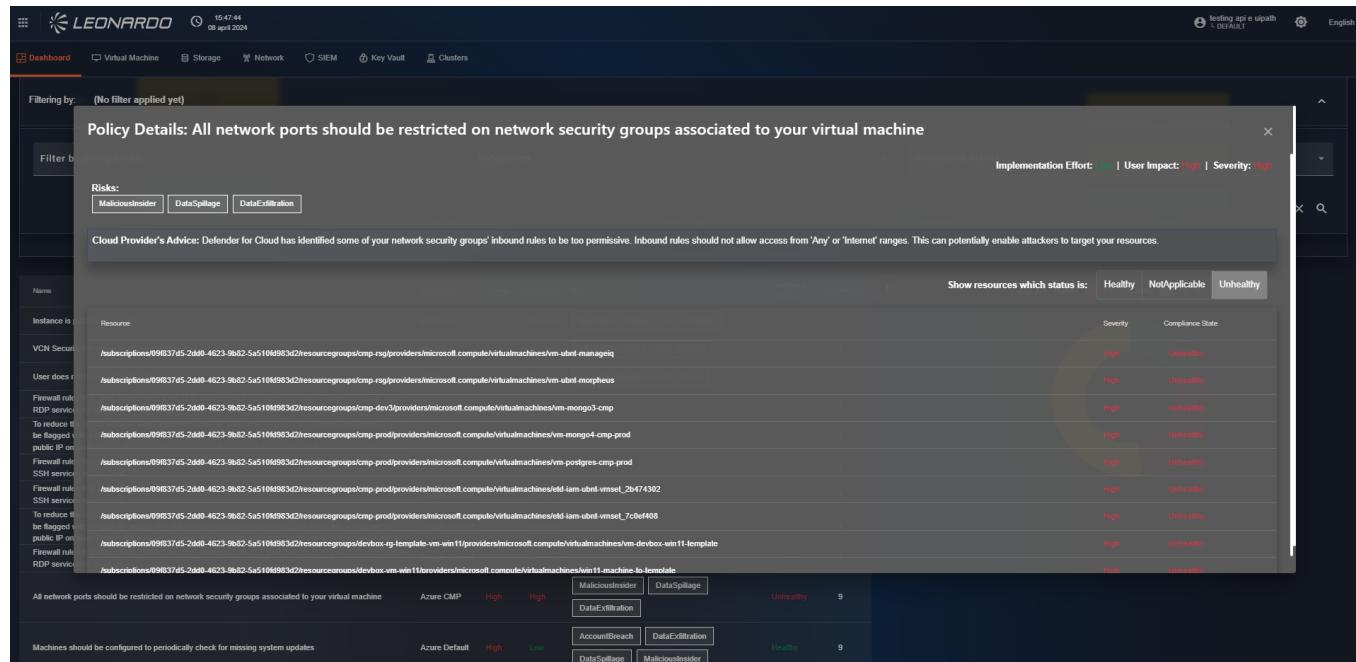

Figura 175 – Security Dashboard

Scrolling down the page, there is the policies table which will be automatically filtered based on the selected filters.

Name	Subsystem	Severity	User Impact	Risks	Compliance State	Occurrences
Instance is publicly accessible	MyOracle	Critical	Moderate	INSTANCE_PUBLICLY_ACCESSIBLE	Unhealthy	1
VCN Security list allows traffic to restricted port	MyOracle	Critical	Moderate	SECURITY_LISTS_OPEN_PORTS	Unhealthy	1
User does not have MFA enabled	MyOracle	Critical	Moderate	NO_MFA_ENABLED_FOR_USER	Unhealthy	7
Firmware rules that allow connections from all IP addresses on TCP port 3389 or UDP port 3389 may expose RDP services to attackers	-	High	Moderate	-	Unhealthy	1
To reduce the attack surface, avoid assigning public IP addresses to your VMs. Stopped instances may still be flagged with a Public IP binding, e.g. if the network interfaces are configured to assign an ephemeral public IP on start. Ensure the network configurations for stopped instances do not include external access	-	High	Moderate	-	Unhealthy	1
Firmware rules that allow connections from all IP addresses on TCP port 22 or SCTP port 22 may expose SSH services to attackers	-	High	Moderate	-	Unhealthy	1
Firmware rules that allow connections from all IP addresses on TCP port 22 or SCTP port 22 may expose RDP services to attackers	Google Default	High	Moderate	-	Unhealthy	1
To reduce the attack surface, avoid assigning public IP addresses to your VMs. Stopped instances may still be flagged with a Public IP binding, e.g. if the network interfaces are configured to assign an ephemeral public IP on start. Ensure the network configurations for stopped instances do not include external access	Google Default	High	Moderate	-	Unhealthy	1

All network ports should be restricted on network security groups associated to your virtual machine	Azure CMP	High	High	MaliciousInsider DataSpillage	Unhealthy	9
Machines should be configured to periodically check for missing system updates	Azure Default	High	Low	AccountBrach DataExfiltration	Healthy	9
				DataSpillage MaliciousInsider		

Figura 176 – Policies table

Clicking on a row in the table will open a detail window where you can find all information related to the selected policy, and the list of affected resources will also be available. It is possible to click on the name of a machine to view its details; in this case, the user will be redirected to the SCMP inventory resource in “view” mode.

The screenshot shows a detailed policy analysis for a virtual machine. At the top, it says "Policy Details: All network ports should be restricted on network security groups associated to your virtual machine". Below this, there's a section titled "Cloud Provider's Advice" with a warning about inbound rules being too permissive. The main table lists resources with their names, instance types, severity, and compliance status. A legend at the bottom indicates that red means "MaliciousInsider", yellow means "DataSpillage", and green means "DataExfiltration".

Figura 177 – Policy details

To exit the detail, you need to click outside the window, which will close automatically.

8.0.2 Dashboards specific to resource type

It is possible to further filter policies by resource type, using the tabs at the top of the page.

Once the resource type is selected, it is possible to navigate the pages following the methods described in the previous paragraph.

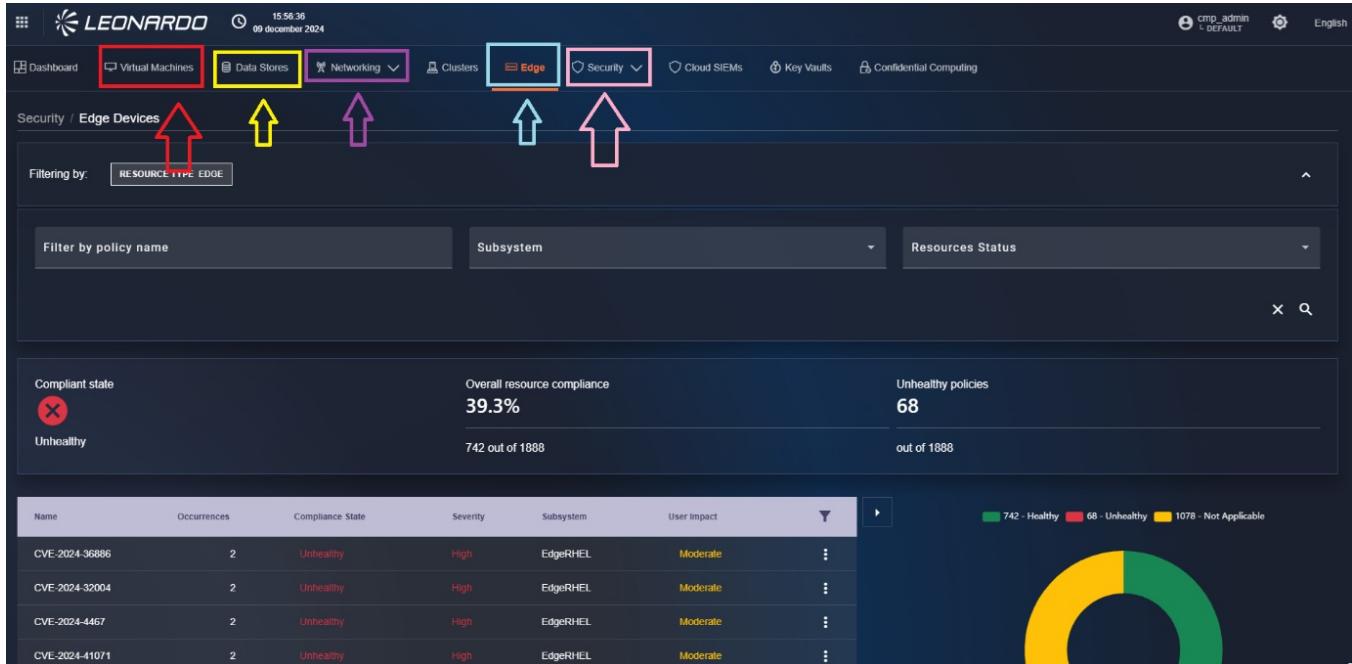

Figura 178 – Virtual Machines compliance Dashboard

8.0.3 SIEM Dashboard

To view the SIEM dashboard, click on the tab that depicts a shield. At the top, there is a dropdown menu where you can select the subscription of interest, while next to it is a dropdown menu where you can select a time range.

Below, there is the “Summary” section which contains information, including for example “Alerts” which indicates the number of alerts. Also within the “Summary” section is the “Incidents by status” chart which indicates incidents by status.

Below the “Summary” section, there is the “Hourly Events Grouped By Type” section which contains a histogram chart indicating hourly events by type.

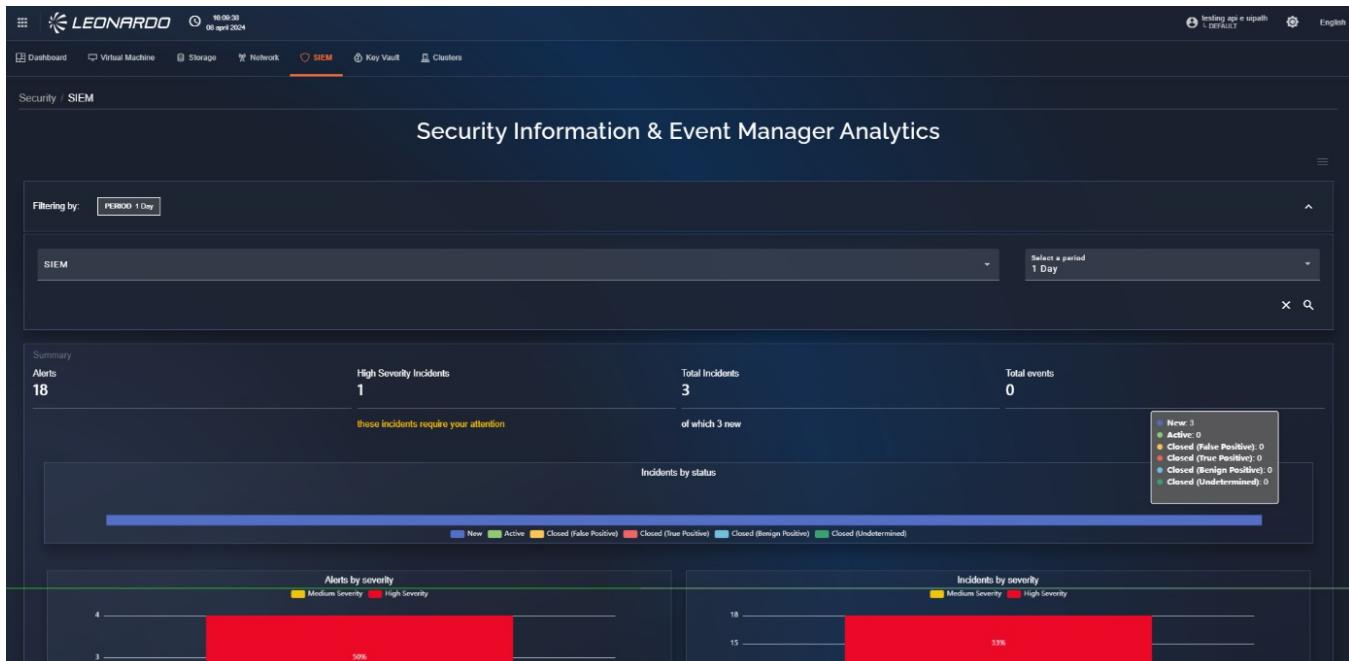

Figura 179 – SIEM Dashboard

Scrolling through the SIEM dashboard, there is the “Event types” chart which indicates all event types.

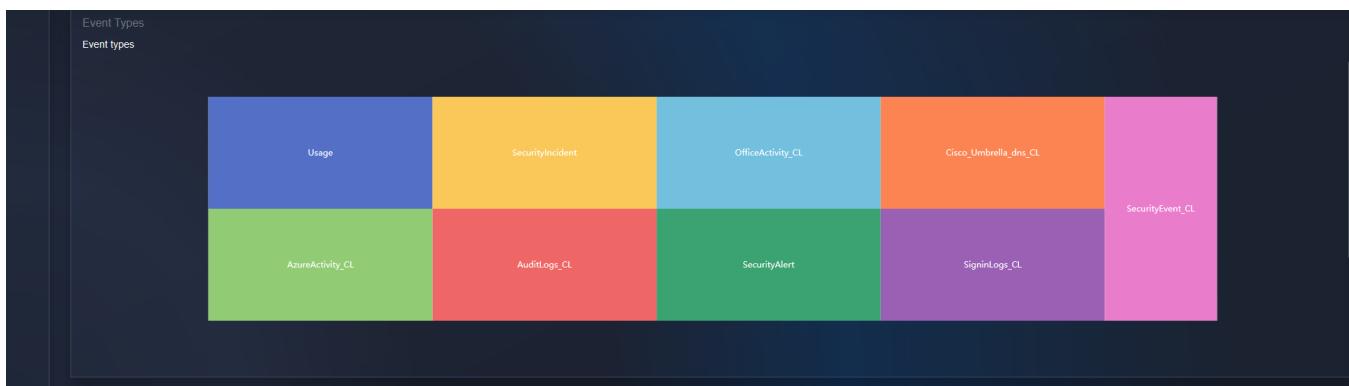

Figura 180 – “Event types” of the SIEM dashboard

Finally, at the bottom of the page, there are two tables: on the left, the “Alert rules” table which shows a set of alarm rules, while on the right, there is the “Incidents” table which shows incidents.

Advanced Multistage Attack Detection

Description: Microsoft Sentinel uses Fusion, a correlation engine based on scalable machine learning algorithms, to automatically detect multistage attacks by identifying combinations of anomalous behaviors and suspicious activities that are observed at various stages of the kill chain. On the basis of these discoveries, Azure Sentinel generates incidents that would otherwise be very difficult to catch. By design, these incidents are low-volume, high-fidelity, and high-severity, which is why this detection is turned ON by default. Since Fusion correlates multiple signals from various products to detect advanced multistage attacks, successful Fusion detections are presented as Fusion incidents on the Microsoft Sentinel Incidents page. This rule covers the following detections: - Fusion for emerging threats - Fusion for ransomware - Scenario-based Fusion detections (122 scenarios) To enable these detections, we recommend you configure the following data connectors for best results: - Out-of-the-box anomaly detections - Microsoft Entra ID Protection - Azure Defender - Azure Defender for IoT - Microsoft 365 Defender - Microsoft Cloud App Security - Microsoft Defender for Endpoint - Microsoft Defender for Identity - Microsoft Defender for Office 365 - Scheduled analytics rules, both built-in and those created by your security analysts. Analytics rules must contain kill-chain (tactics) and entity mapping information in order to be used by Fusion. For the full description of each detection that is supported by Fusion, go to <https://aka.ms/sentinelfusion>.

Enabled: Yes

Figura 184 – Viewable resources

Clicking on a row in the table allows you to view the detail of the selected resource.

Figura 185 – Key details

8.0.5 Clusters Dashboard

At this point, the user is on the “Dashboard” tab page where all alerts generated by the configured “Cluster” type subsystems in SCMP are shown in an aggregated manner.

At the top, there is a filter bar that allows filtering results by namespace, subscription, and/or policy name.

After that, the user notices the presence of the bar chart indicating the total number of “alerts” received, subdivided by subsystem.

By hovering the mouse over a section of the chart, we can see that the values displayed on the page are updated to show a preview of the detail.

It is possible to click on a section of the chart to automatically apply the “subsystem” filter.

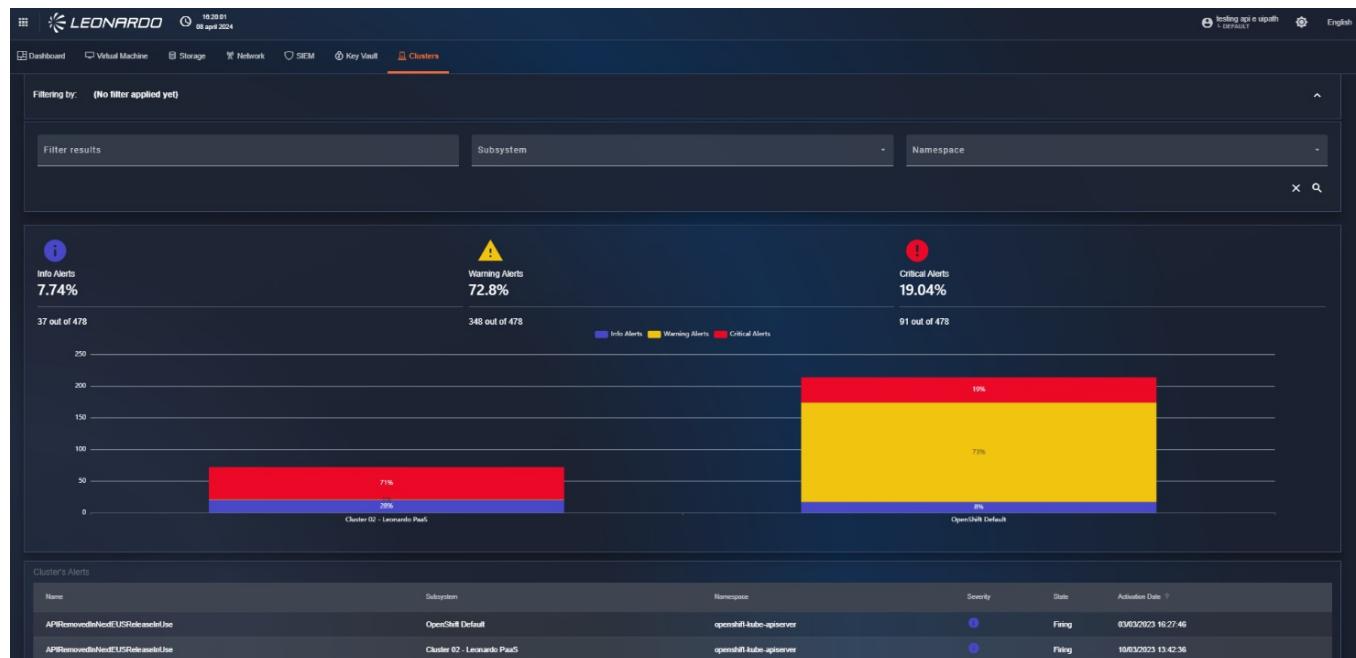

Figura 186 – “Cluster alerts” Dashboard

Scrolling down the page, there is the “alerts” table which will be automatically filtered based on the selected filters.

Figura 187 – Alerts table

Clicking on a row in the table will open a detail window, where you can find all information related to the selected “alert”.

The screenshot shows a detailed alert for a policy named "All network ports should be restricted on network security groups associated to your virtual machine". The alert is categorized under "Risks" as "MaliciousInsider", "DataSpillage", and "DataExfiltration". It includes a "Cloud Provider's Advice" section from Defender for Cloud. The alert table lists various resources with their status (Severity: High, Compliance State: Unhealthy) and provides links to Azure CMP and Azure Default for further investigation.

Name	Resource	Severity	Compliance State
VCN Security	/subscriptions/09837d5-2dd0-4623-9b82-5a5104953d2/resourcegroups/cmp-rng/providers/microsoft.compute/virtualmachines/vm-ubuntu-manage0	High	Unhealthy

Figura 188 – Alert details on clusters

To exit the detail, you need to click outside the window, which will close automatically.

8.0.6 Compliance Dashboard

To view the compliance dashboard, click on the tab that depicts a document in the security module.

15 Dec 2025

09.00

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

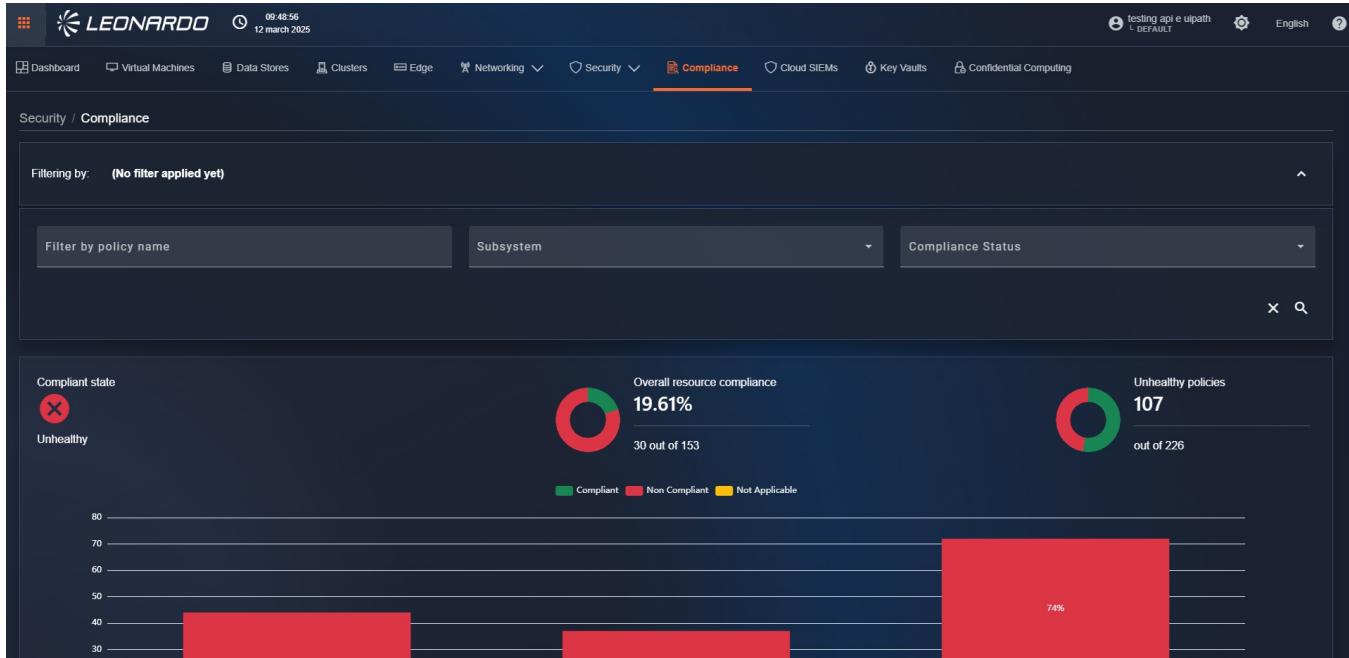

Figura 189 – Compliance dashboard

At this point, the user is on the "Compliance" tab page, composed of 4 sections. The first section contains filters that allow searching by policy name, subsystem, and/or compliance status. The second section, always active, contains pie charts that indicate the general status of the filtered resources.

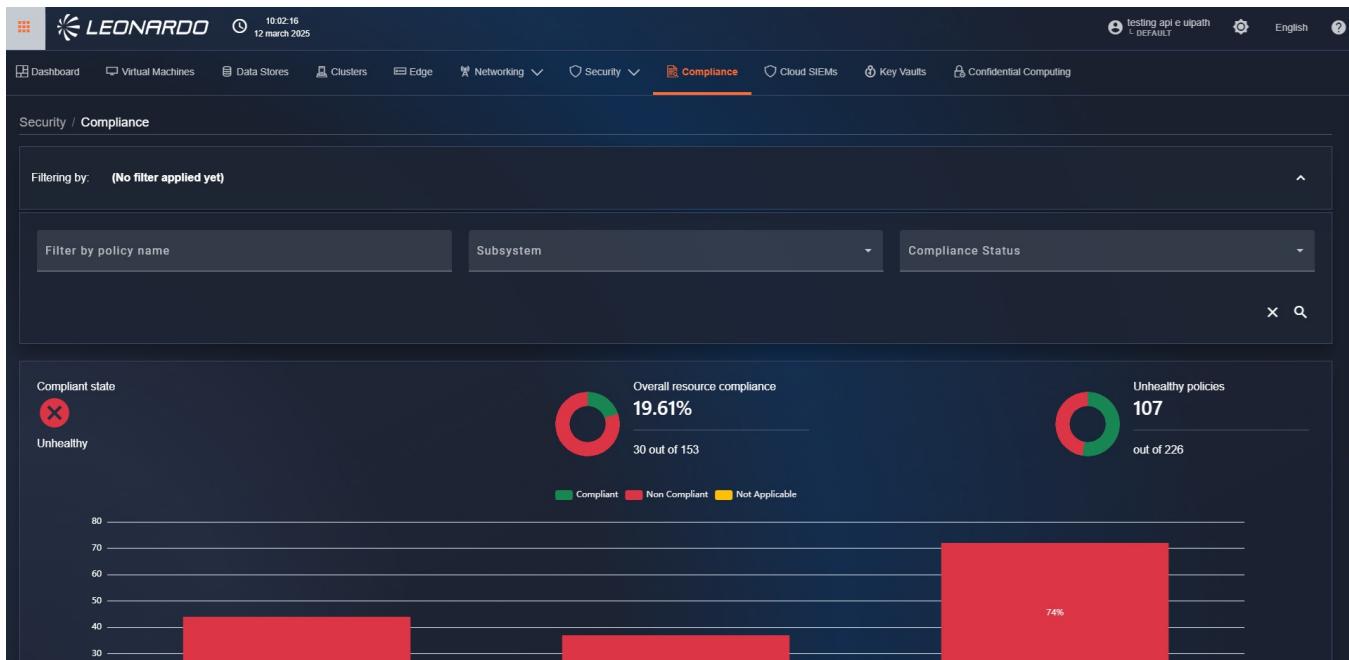

Figura 190 – “Filters” and “pie charts” sections

The third section, active only if multiple different subsystems are present in the results, shows a bar chart, subdivided by provider, of the compliance status of resources. The last section contains a table with general information on policy groups.

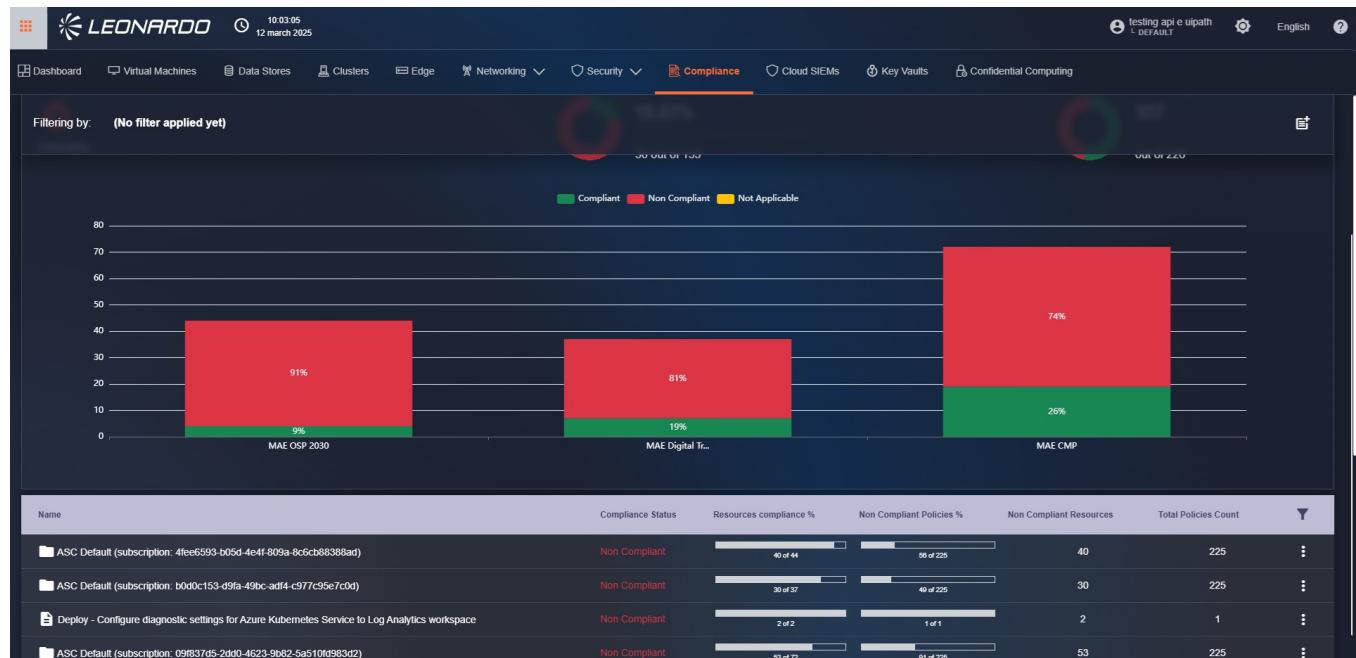

Figura 191 – “Bar charts” and “table” sections

Clicking on a row in the table opens a modal where it will be possible to view the list of all policies configured in the group, with the relative resource count. Still within the modal, we can click on one of the displayed policies; doing so will show at the bottom the list of all machines assigned to the policy and their respective status. Next to each resource, a "link" button is available; once clicked, the user will be redirected to the inventory page of the selected resource.

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

The screenshot shows a policy set named 'ASC Default' with a subscription ID of b0d0c153-d9fa-49bc-adf4-c977c95e7c0d. The interface includes a sidebar with navigation links like Dashboard, Virtual Machines, and Catalog. The main content area displays a table of resources under the heading 'Policy Set's Details'. The table has columns for Name, Total Resources Count, Policy Assignment Name, Subsystem, and Compliance Status. One resource is marked as 'Non Compliant' (MAE Digital Transformation) while others are 'Compliant'. Below the table, a message states 'Resources related to the policy: A vulnerability assessment solution should be enabled on your virtual machines'. A detailed list of resources follows, each with a 'Resource Link' button.

Name	Total Resources Count	Policy Assignment Name	Subsystem	Compliance Status
A Microsoft Entra administrator should be provisioned for MySQL servers	0	ASC Default (subscription: b0d0c153-d9fa-49bc-adf4-c977c95e7c0d)	MAE Digital Transformation	Compliant
A Microsoft Entra administrator should be provisioned for PostgreSQL servers	0	ASC Default (subscription: b0d0c153-d9fa-49bc-adf4-c977c95e7c0d)	MAE Digital Transformation	Compliant
A maximum of 3 owners should be designated for your subscription	1	ASC Default (subscription: b0d0c153-d9fa-49bc-adf4-c977c95e7c0d)	MAE Digital Transformation	Non Compliant
A vulnerability assessment solution should be enabled on your virtual machines	6	ASC Default (subscription: b0d0c153-d9fa-49bc-adf4-c977c95e7c0d)	MAE Digital Transformation	Non Compliant
API Management APIs should use only encrypted protocols	0	ASC Default (subscription: b0d0c153-d9fa-49bc-adf4-c977c95e7c0d)	MAE Digital Transformation	Compliant

Figura 192 – Policy details

9 Catalog

The Catalog section has three important features:

- Displaying the list of installable assets retrieved from providers, along with their associated prices and regions.
- Enabling the tenant administrator to define items that can be subsequently used for provisioning.
- Enabling the tenant administrator to define items that can be subsequently used within What If module simulations.

The retrieved prices, in addition to being visible within the asset's details, are used for What If scenarios and cost calculation.

To access the Catalog functionality, click on the bento button in the upper left corner.

Then, click on "Catalog".

Figura 193 – Accesso a Catalog

At this point, the user is on the "Resources" tab page.

We can divide the functionality into 3 sections to specify its behavior:

- SCMP catalog items (yellow box in the image).
- Provider catalog items (green box in the image).
- SCMP catalog services and blueprints (red box in the image).

Below, we will analyze each group of functionalities separately.

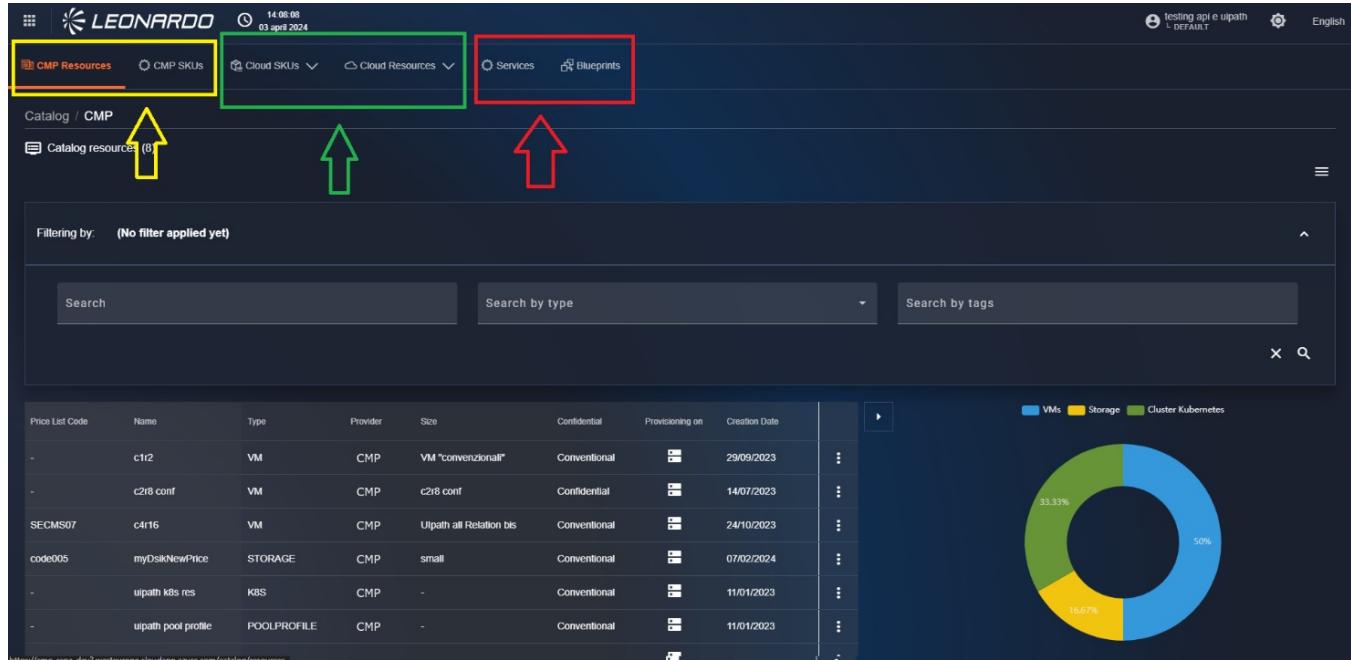

Figura 194 – Catalogo della SCMP

9.0.1 SCMP Catalog Item Management

On the page, there is a series of filters that, once selected and by clicking on the magnifying glass button, will be used to filter the list of results.

The screenshot shows the Leonardo SCMP interface. At the top, there's a navigation bar with the Leonardo logo, date (16.02.07 / 03 aprile 2024), and user information (testing api e upath). Below the header, the main menu includes CMP Resources, CMP SKUs, Cloud SKUs, Cloud Resources, Services, and Blueprints. The current view is under the Catalog / CMP section, showing 'Catalog resources (3)'. A filtering bar at the top allows filtering by type (set to 'TYPE VM'), search by type ('VM'), and search by tags. The main table lists three VM resources:

Price List Code	Name	Type	Provider	Size	Confidential	Provisioning on	Creation Date
-	c1r2	VM	CMP	VM "convenzionali"	Confidential	Conventional	29/09/2023
-	c2r6 conf	VM	CMP	c2r6 conf	Confidential	Conventional	14/07/2023
SECMS07	c4r16	VM	CMP	Uipath all Relation bis	Confidential	Conventional	24/10/2023

Below the table, there are pagination controls (Items per page: 20, 1 - 3 of 3) and a large blue donut chart on the right labeled 'VMs' with '100%' completion.

Figura 195 – Catalogo SCMP filtrato

Association between SCMP catalog resource/SKU and Provider catalog resource/SKU

To allow the system to correctly calculate costs, it is necessary that the SCMP catalog resource or SKU contains a reference to the actual ID retrieved from the provider (as explained in this section) in order to correctly overwrite the cost of the resource / SKU.

Next to the magnifying glass button, there is an "X" button to reset the filters and the resource table.

Below the search filter, there is a search filter for tags.

Click on it and select a tag; at this point, the table returns the resources associated with the tag selected by the user.

9.0.1.1 Resources and relationships between resources

Within the SCMP, it is possible to configure a "Relationship" type resource. This relationship allows mapping machines from various providers to modify their costs and enable their use in other functionalities (e.g., for cost calculation).

Automatic Relationships

If a price list resource with the provider's UUID but no relationship is present in the SCMP catalog, the relationship will be created automatically, and costs will be updated accordingly. After a few minutes, the relationship will also be visible within the catalog.

To access the relationships page, click the "SCMP Resources" tab at the top of the Catalog functionality.

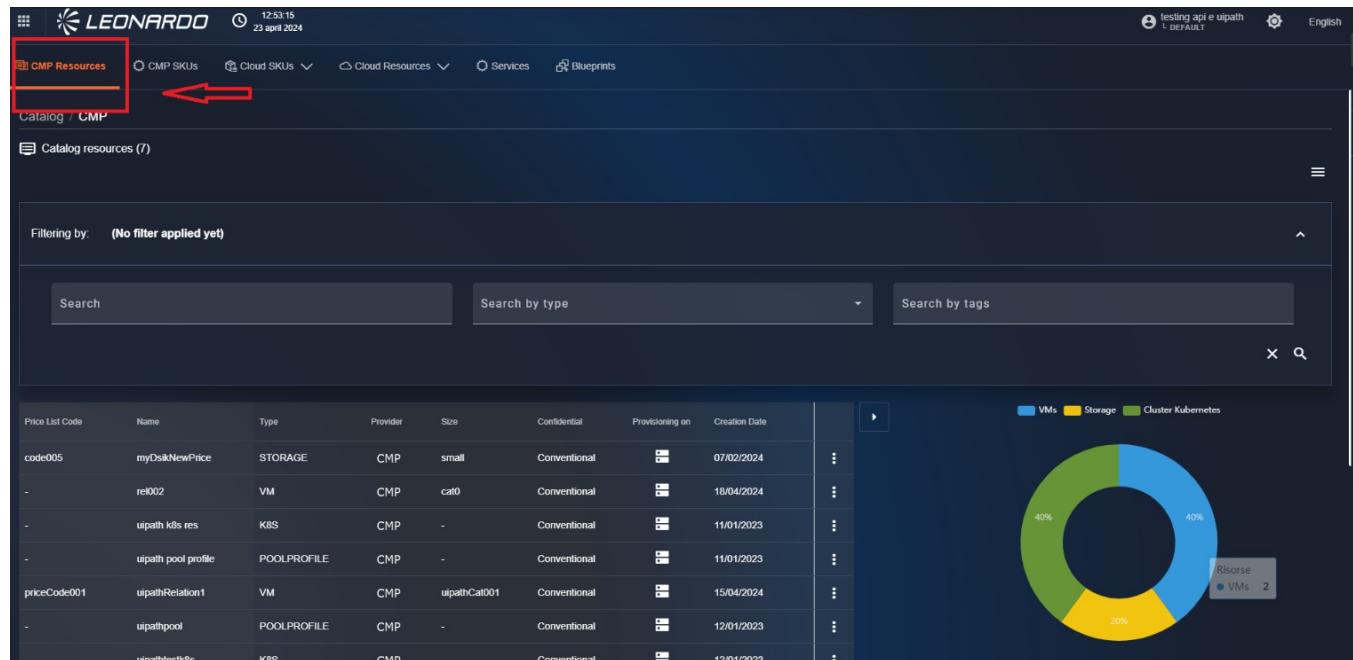

Figura 196 – Accesso a "SCMP resources"

At the top, there is a filter section that allows searching by:

- "Search": allows entering free text for searching.
- "Search By tags": allows searching using tags associated with resources.
- "Search by Service name": allows searching by service name.

9.0.1.1.1 Resource Export

To export the list of Catalog resources present in the list, on the page, in the upper right corner, click on the hamburger menu, and then click on "Export".

The operator will have the option to export the list of results in .csv and/or .json format.

Name	Type	Provider	Size	Confidential	Provisioning on	Creation Date	⋮

Figura 197 – Scaricare la lista di risultati

9.0.1.1.2 Forced Catalog Update Functionality

Through the Force Sync functionality, it is possible to request a catalog update by clicking on the hamburger menu and then clicking on "Force Sync".

The screenshot shows the Leonardo Secure Cloud Management Platform interface. In the top right corner of the main content area, there is a button labeled "Force Sync" with a circular arrow icon. This button is highlighted with a red rectangular box.

Figura 198 – Funzionalità Force Sync

9.0.1.1.3 Catalog Relationship Creation

To create a resource in the Catalog, always on the page, in the upper right corner, click on the hamburger menu, and then click on "Add Catalog Resource".

The screenshot shows the Leonardo Secure Cloud Management Platform interface. In the top right corner of the main content area, there is a button labeled "Add Catalog Resource" with a plus sign icon. This button is highlighted with a red rectangular box.

Figura 199 – Opzione per aggiungere una risorsa

At this point, the user is on the page where they can select the type of resource to create.

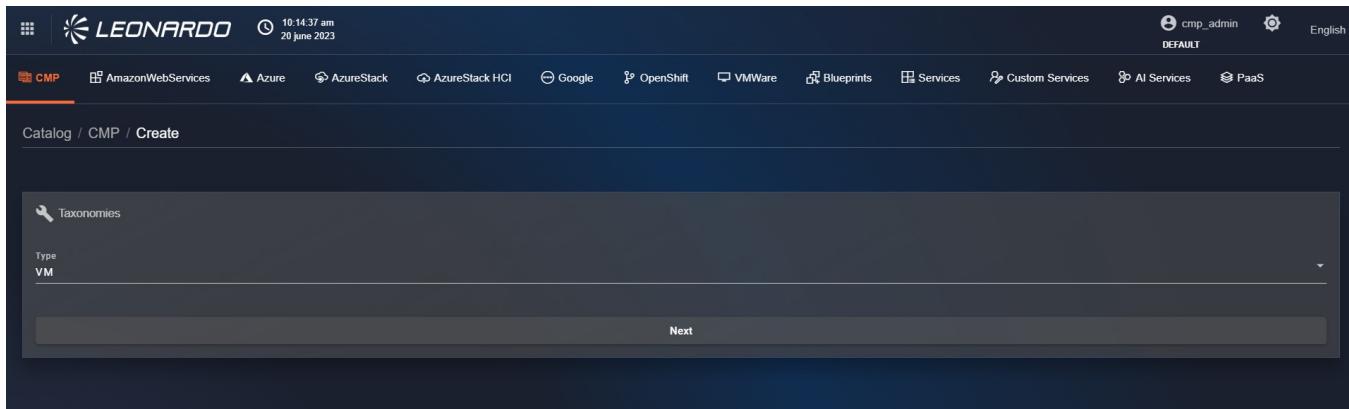

Figura 200 – Selezione del tipo di risorsa da creare

From the dropdown menu, select the type of resource to create. Then, click the "Next" button. You will be on the resource compilation page.

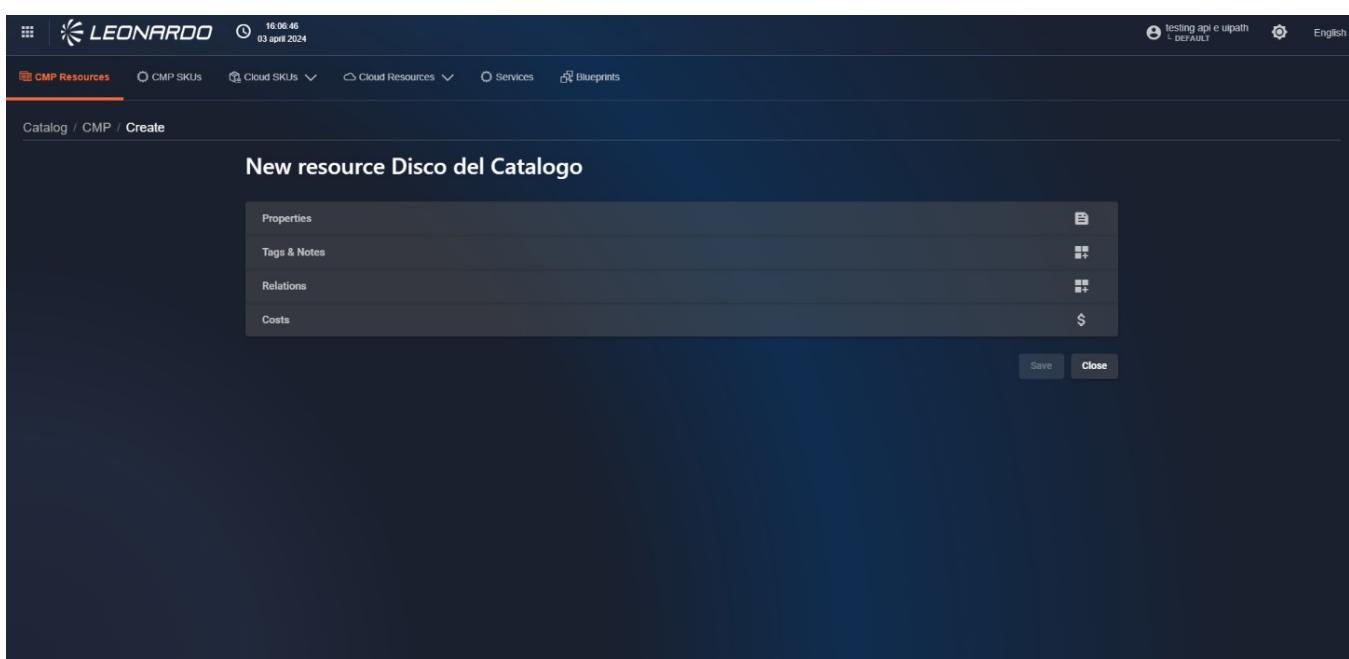

Figura 201 – Esempio di form per la creazione di una relazione

The individual parameters to be entered in the "Properties" section are specified in the table:

Mandatory parameters are indicated with *

Name	Type	Description	Example
category	string	Enter the resource's category	CAT000 4BT
Price list code	string	Enter the price list identifier code from which associations are derived	PRC005 DE
confidential	boolean	If enabled, indicates that the resource is confidential	false
description	string	Enter a free description of the resource	Low end machine
Name*	string	Enter the resource name	8Core16 GB- small
RAM(GiB)*	integer	Enter here the quantity in GiB used by the machines included in the relationship	16
vCPU*	integer	Enter here the number of vCPUs used by the machines included in the relationship	8

On the resource creation page, fill in all fields in the "Properties" section. After doing this, select one or more tags for the "Add SCMP tag..." field and fill in notes in the "Tags & Note" section.

Figura 202 – Sezione tag e note

In the "Relations" section, open the left section. Subsequently, it is possible to use the "search" filters with free text or select a "System Type" from those available to filter the resource table.

Once the resource to be associated is identified, drag and drop it from the right side of the page to the left side.

It is possible to add only one resource per provider type. If the user tries to insert another resource from the same provider, a pop-up will appear inviting the user to add only one resource per provider.

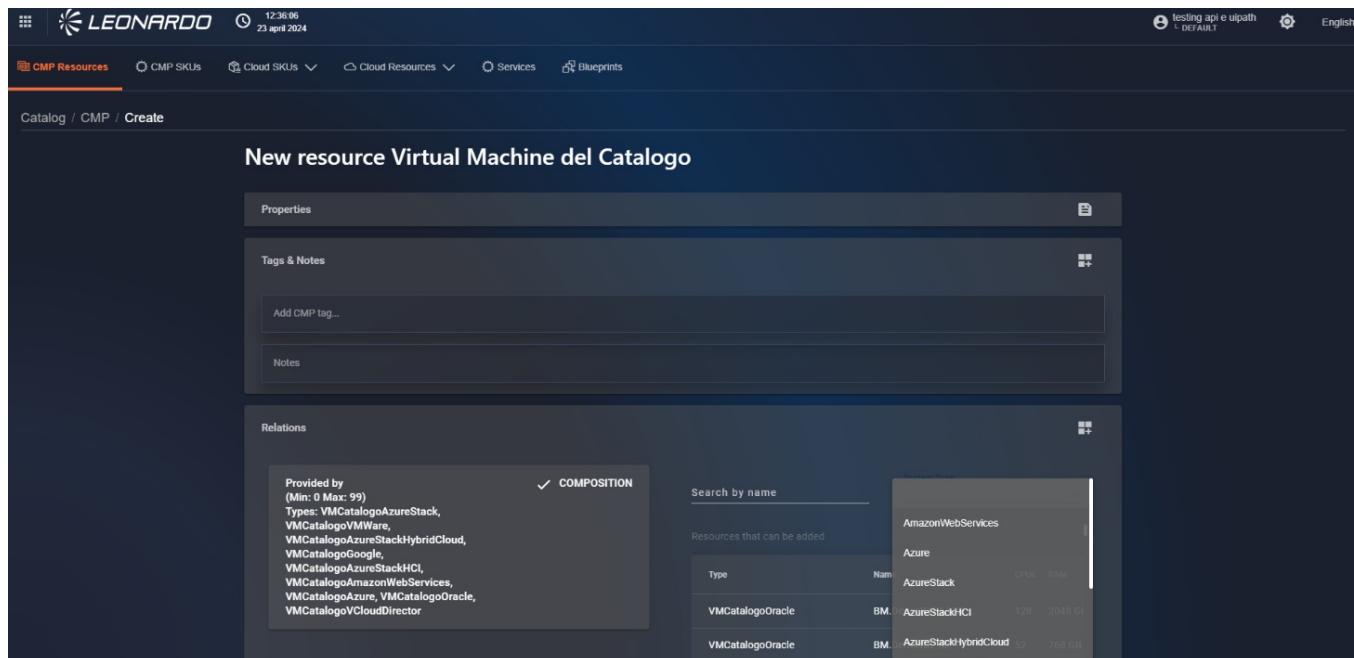

Figura 203 – Selezione del provider per associare le risorse

We can make a "single" association by entering only one machine in this section. In this way, the system allows us to manually select a customized price to associate with the resource in the "Cost" section below. To do this, select the billing interval (hourly, daily, weekly, monthly) and enter the cost relative to the selected period on the right.

The screenshot shows a modal window titled "New resource Virtual Machine del Catalogo". The "Costs" tab is selected, displaying a dropdown menu with options: Hourly, Daily, Weekly, and Monthly. A text input field shows "€100". At the bottom right of the modal are "Save" and "Close" buttons.

Figura 204 – Sezione costi delle relazioni

By selecting more than one machine per provider, the cost section is automatically hidden; the applied costs will be defined by the percentages configured in the subsystems.

The screenshot shows a "Relations" section for a VM Catalogo Oracle resource. It lists three types of associations: VM Catalogo Azure Stack, VM Catalogo Google, and VM Catalogo Oracle. To the right, a "Resources that can be added" sidebar lists various VM types with their names, CPU, and RAM specifications. For example, VM Catalogo Oracle includes BM.DenseIO.E4.128, BM.DenseIO2.S2, BM.Optimized3.36, etc.

Figura 205 – Risorse associate alla risorsa SCMP

Once the resources are related, an illustrative diagram will automatically be created in the 'Relations Chart' section.

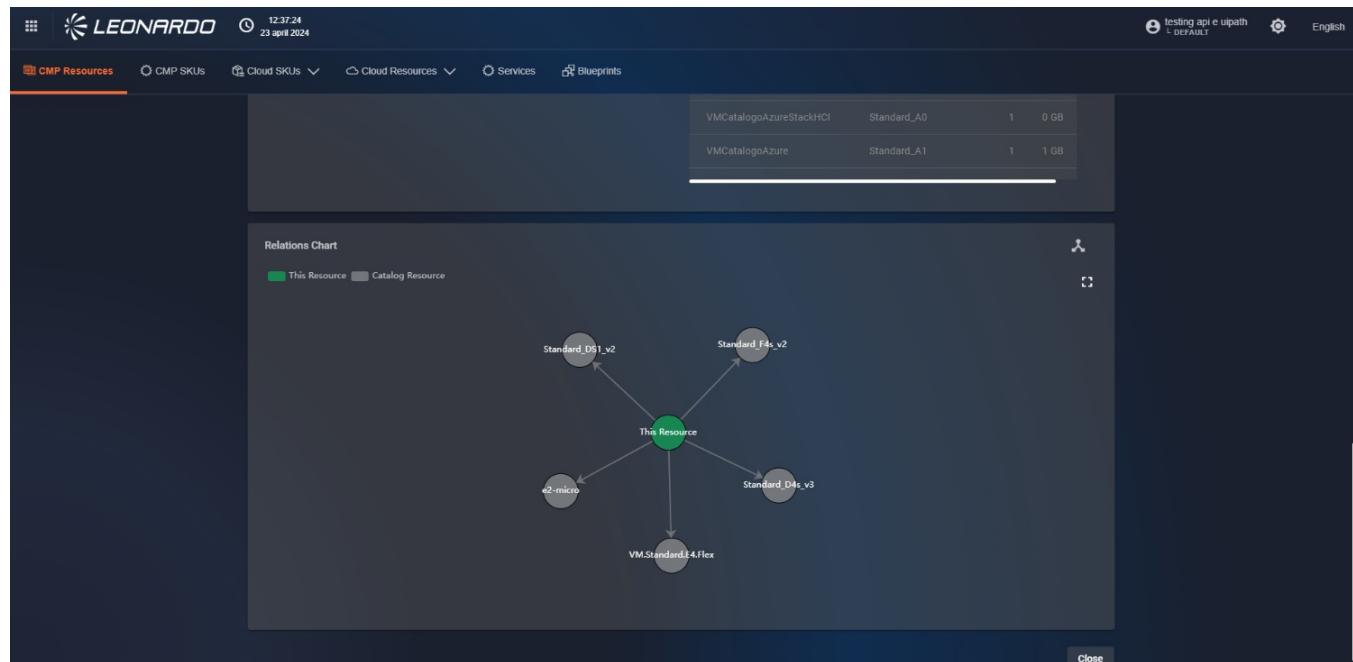

Figura 206 – Creazione automatica del Relation Chart

Finally, in the bottom right, click the "Save" button to save the changes. A banner will appear at the bottom, notifying the user of the successful resource creation, and the user will be redirected to the page containing the list of resources.

9.0.1.1.4 Using the Catalog Table

9.0.1.1.4.1 Resource Summary View

To view the data of an SCMP resource, on the "Resources" page of Catalog, in the list of resources, click on the record of interest for a resource. A window will appear showing brief information about the identified resource: System, Name, Size, Update Date, RAM, and CPU as shown in the following image.

Figura 207 – Dettaglio rapido delle risorse di catalogo

9.0.1.1.4.2 Viewing Catalog Relationships

To view the data of an SCMP resource, on the "Resources" page of Catalog, in the list of resources, click on the kebab menu for a resource and then click on "Show".

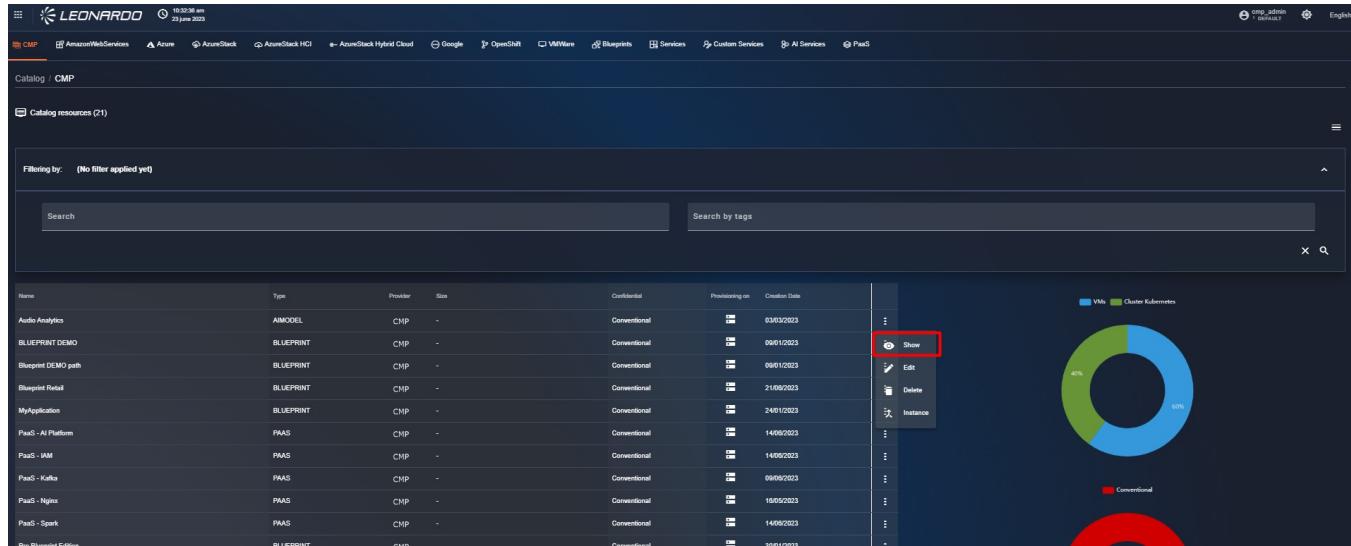

Figura 208 – Accesso alla risorsa in modalità view

After doing this, the user is on the resource page in view mode, where they can see the data but cannot modify it.

The screenshot shows a detailed view of a virtual machine resource in the Leonardo Secure Cloud Management Platform. The main title is "Show Virtual Machine del Catalogo". The left panel displays the "Virtual Machine del Catalogo (v1.1)" table with the following data:

System	CMP
Name	vm-small-all-Azure
Size	Standard_B4ms,Ds1_v2,F8s_v2
Update Date	06/06/2023

The right panel is titled "Details" and lists the following specifications:

Details	
Name	vm-small-all-Azure
RAM(GiB)	8
N° VCPUs	2

Below the main content, there is a sidebar with several sections: Properties, Tags & Notes, Relations, Costs, and Relations Chart. A "Close" button is located at the bottom right of the detail view.

Figura 209 – Dettaglio completo delle risorse di catalogo

The detail of a resource is divided into various sections:

- Details.
- Properties.
- Tags & Notes.
- Relations.
- Cost, if present.
- Relations Chart.

Figura 216 – Eliminazione di una risorsa

Once done, a modal appears where it is necessary to click the "Remove" button to confirm the resource deletion.

Remove resource

IMPORTANT: Removing this resource problems to other linked resources could happen. Are you sure you really want to remove the resource Audio Analytics?

Figura 217 – Conferma eliminazione della risorsa

9.0.1.2 Resources and relationships between SKUs

Within the SCMP, it is possible to configure an "SCMP SKU" type resource. This relationship allows mapping SKUs received from providers to define their costs and the unit of measure displayed in the system.

To access the SKUs page, click the "SCMP SKU" tab at the top of the Catalog functionality.

Figura 218 – Accesso a "SCMP SKU"

At the top, there is a filter section that allows searching by:

- "Search": allows entering free text for searching.
- "Search By tags": allows searching using tags associated with resources.
- "Search by Service name": allows searching by service name.

9.0.1.2.1 Export of Catalog Resources

To export the list of Catalog resources present in the list, always on the "SCMP" tab page, in the upper right corner, click on the hamburger menu, and then click on "Export".

The operator will have the option to export the list of results in .csv and/or .json format.

Name	Type	Provider	Size	Confidential	Provisioning on	Creation Date	Actions
Audio Analytics	AIMODEL	CMP	-	Conventional	2023-03-03	2023-03-03	⋮

Secure Cloud Management Platform

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there's a header with the Leonardo logo, the date (23 aprile 2024), and a timestamp (09:52:25). Below the header, the navigation bar includes links for 'CMP Resources', 'Cloud SKUs', 'Cloud Resources', 'Services', and 'Blueprints'. The main content area is titled 'Catalog / CMP SKUs' and shows a sub-section 'SKUs List (0)'. On the left, there are search and filter options: 'Search' (with placeholder 'Search by Service Name'), 'Search by tags', and a 'Filtering by' dropdown set to '(No filter applied yet)'. On the right, there's a toolbar with icons for 'Add Catalog Resource' (highlighted with a red box and arrow), 'Export', and other actions. Below the search area, a message says 'No SKUs found'. At the bottom, there are pagination controls for 'Items per page: 20' and '0 of 0'.

Figura 220 – Opzione per aggiungere una risorsa “SKU”

At this point, the user is on the "SKU" resource creation page. Click on the accordions on the page to view their details.

The screenshot shows the 'New SKU' creation page. The title 'New SKU' is at the top. Below it is a section with four expandable accordions: 'Properties' (with a pencil icon), 'Tags & Notes' (with a plus sign icon), 'Relations' (with a plus sign icon), and 'Costs' (with a dollar sign icon). At the bottom of the page are two buttons: 'Save' and 'Close'.

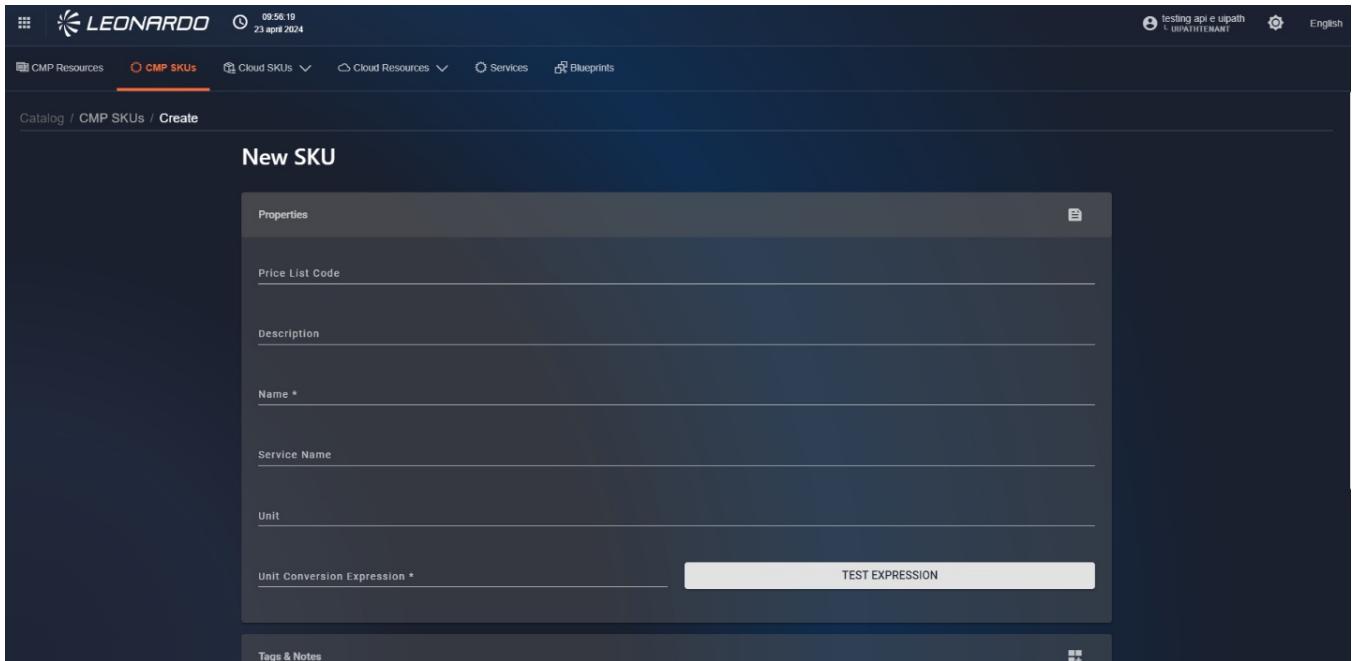

Figura 221 – IPagina di creazione “SKU”

In the "Properties" section, fill in all fields defined in the table.

Mandatory parameters are indicated with *

Name	Type	Description	Example
Price list code	string	Enter the price list identifier code from which associations are derived	PRI002FG
description	string	Enter a free description of the SKU	This sku is the basic vm on this provider
name *	string	Enter the SKU name	Simple vm sku
Service name	string	Enter the name of the service related to the SKU	enter the service name
unit	string	Enter text that will be used as the "unit of measure" displayed across all functionalities	MB/hour

Name	Type	Description	Example
Unit conversion Expression*	String	Enter the conversion formula between the value received from the provider and the value that will be used in the SCMP (conversion between the provider's unit of measure and the unit of measure indicated in the SKU relationship) "\$var" indicates the value received from the provider	\$var * 24 / 100

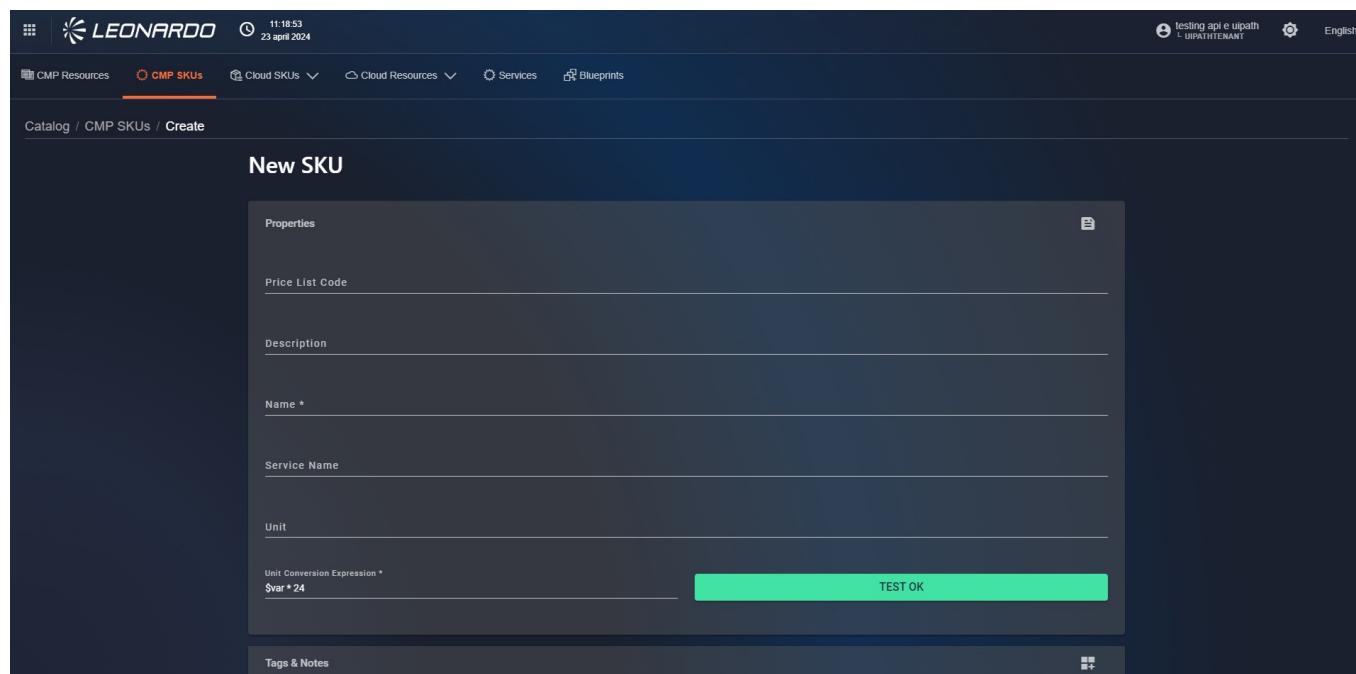

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there is a navigation bar with links for CMP Resources, CMP SKUs (which is the active tab), Cloud SKUs, Cloud Resources, Services, and Blueprints. On the right side of the header, there are user profile and language selection options. Below the header, the URL 'Catalog / CMP SKUs / Create' is visible. The main content area is titled 'New SKU'. It contains several input fields: 'Price List Code', 'Description', 'Name *' (with an asterisk indicating it is required), 'Service Name', 'Unit', and 'Unit Conversion Expression *'. To the right of the 'Unit Conversion Expression' field is a button labeled 'TEST EXPRESSION'. At the bottom of the form, there is a 'Tags & Notes' section.

Figura 222 – Compilazione dei campi, selezione

Properties

After entering the conversion formula, it is necessary to click the "Test expression" button to verify its correctness.

If it has been entered correctly, the button will turn "Green" with "TEST OK" written on it; otherwise, it will turn "Red" with "KO". In this case, the possibility of saving the relationship is inhibited.

The screenshot shows the Leonardo Secure Cloud Management Platform interface. The top navigation bar includes links for CMP Resources, CMP SKUs (which is the active tab), Cloud SKUs, Cloud Resources, Services, and Blueprints. The timestamp on the top right is 11:18:53, 23 April 2024. The user is in the Catalog / CMP SKUs / Create section. A modal window titled 'New SKU' is open, showing fields for Price List Code, Description, Name (marked with an asterisk), Service Name, Unit, and Unit Conversion Expression. The expression '\$var *24' is entered in the conversion field. A large green button labeled 'TEST OK' is visible at the bottom of the modal. Below the modal, there's a 'Tags & Notes' section.

Figura 223 – Conferma della formula di conversione

Subsequently, select one or more tags for the "Add SCMP tag..." field and fill in notes in the "Tags & Note" section.

In the "Relation" section, it is possible to select one or more SKUs from the various provider catalogs to relate them and unify their costs. To do this, click on the "Composition" section on the left; a dark section will open where, using drag and drop, we can move the available SKUs to the right section.

In the right section, filters can be used to display only relevant results. The available filters are: the origin provider, the service name, and a free text field (in yellow in the image).

15 Dec 2025

09.00

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

The screenshot shows the 'Relations' section of the SKU management interface. At the top, there's a search bar labeled 'Search by name' with 'Provider: Google' and 'Service Name: SQL Server 2014 Express on H...'. Below the search bar is a list of resources that can be added, with one item highlighted by a red box: 'Licensing Fee for Standard Plan on VM with 12 vCPU or more'. A yellow arrow points from the search bar area towards this highlighted item.

Figura 224 – Drag and drop Relazioni SKU

Once the resources are related, an illustrative diagram will automatically be created in the 'Relations Chart' section.

The screenshot shows the 'Relations Chart' section. It features a diagram with three nodes: a green circle labeled 'This Resource' at the top left, and two red circles labeled 'Licensing Fee for Standard Plan...' at the bottom. Arrows connect 'This Resource' to each of the two red nodes. The chart includes a legend: a green square for 'This Resource' and a red square for 'SKU'. There are also icons for zooming in and out.

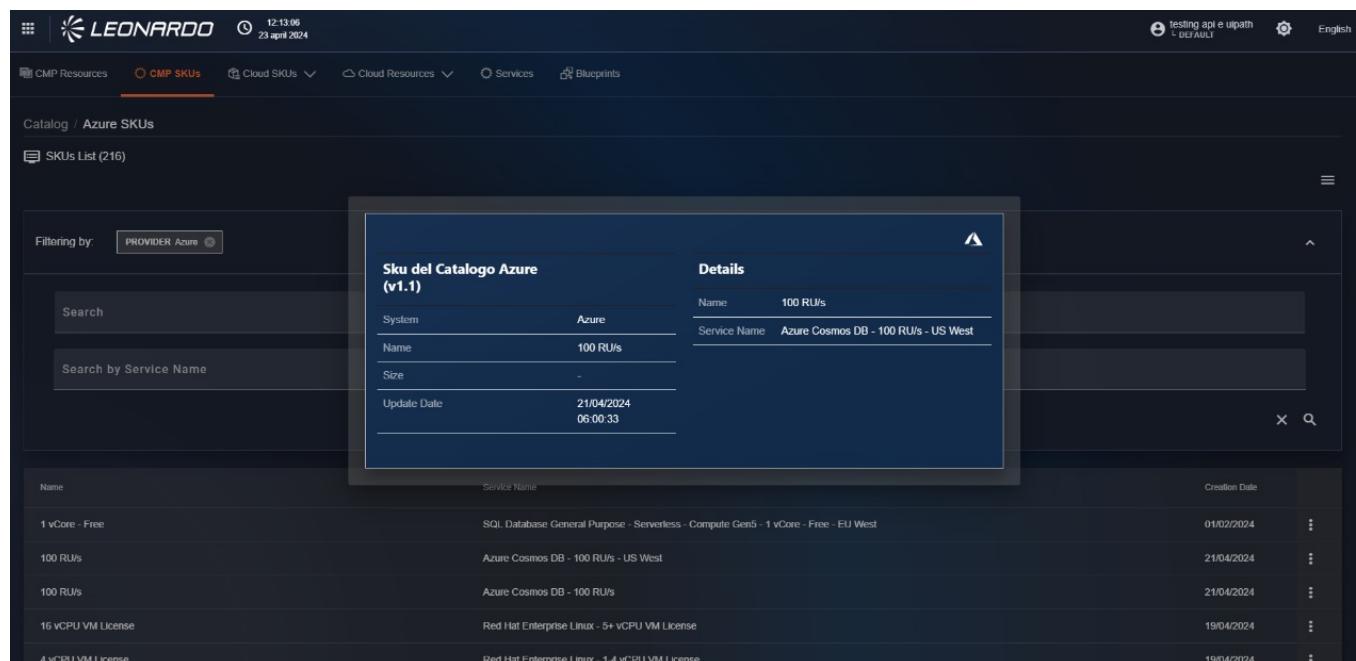

Figura 225 – Creazione automatica del Relation Chart

Finally, click the save button to confirm the creation of the SKU relationship. Upon completion, you will return to the page containing the list of SKU relationships, where you can find the new relationship in the list.

9.0.1.2.3 Using the Catalog Table

9.0.1.2.3.1 Catalog Resource Summary View

To view the data of an SKU resource, in the list of resources, click on the record of interest for a resource. A checkbox will appear showing brief information about the identified resource: System, Name, Size, Update Date, name, and service as shown in the following image.

Name	Service Name	Creation Date
1 vCore - Free	SQL Database General Purpose - Serverless - Compute Gen5 - 1 vCore - Free - EU West	01/02/2024
100 RU/s	Azure Cosmos DB - 100 RU/s - US West	21/04/2024
100 RU/s	Azure Cosmos DB - 100 RU/s	21/04/2024
16 vCPU VM License	Red Hat Enterprise Linux - 5+ vCPU VM License	19/04/2024
4 vCPU VM License	Red Hat Enterprise Linux - 1-4 vCPU VM License	19/04/2024

Figura 226 – Dettaglio rapido delle risorse SKU

9.0.1.2.3.2 Viewing Relationships in the Catalog

To view the data of an SKU resource, in the list of resources, click on the kebab menu for a resource and then click on "Show".

Figura 234 – Eliminazione di una risorsa SKU

Once done, a modal appears where it is necessary to click the "Remove" button to confirm the resource deletion.

The screenshot shows the Leonardo Secure Cloud Management Platform interface. A modal window titled 'Remove resource' is displayed in the center. It contains a message: 'IMPORTANT: Removing this resource problems to other linked resources could happen. Are you sure you really want to remove the resource Audio Analytics?'. At the bottom of the modal, there are two buttons: 'Cancel' and 'Remove', with 'Remove' highlighted by a red box. The background table and donut chart are visible but dimmed.

Figura 235 – Conferma eliminazione della risorsa

9.0.1.3 Scheduled Import of Catalog Items

Manually entering catalog resources is a very long and costly operation. To simplify this, the user is given the possibility to insert an "Excel" file containing data that will then be automatically imported on the day indicated as "Start validity".

9.0.1.3.1 New Import

To insert a new price list, it is necessary to click the "hamburger menu" available in the upper right corner of the catalog resources page and select "Import Catalogue".

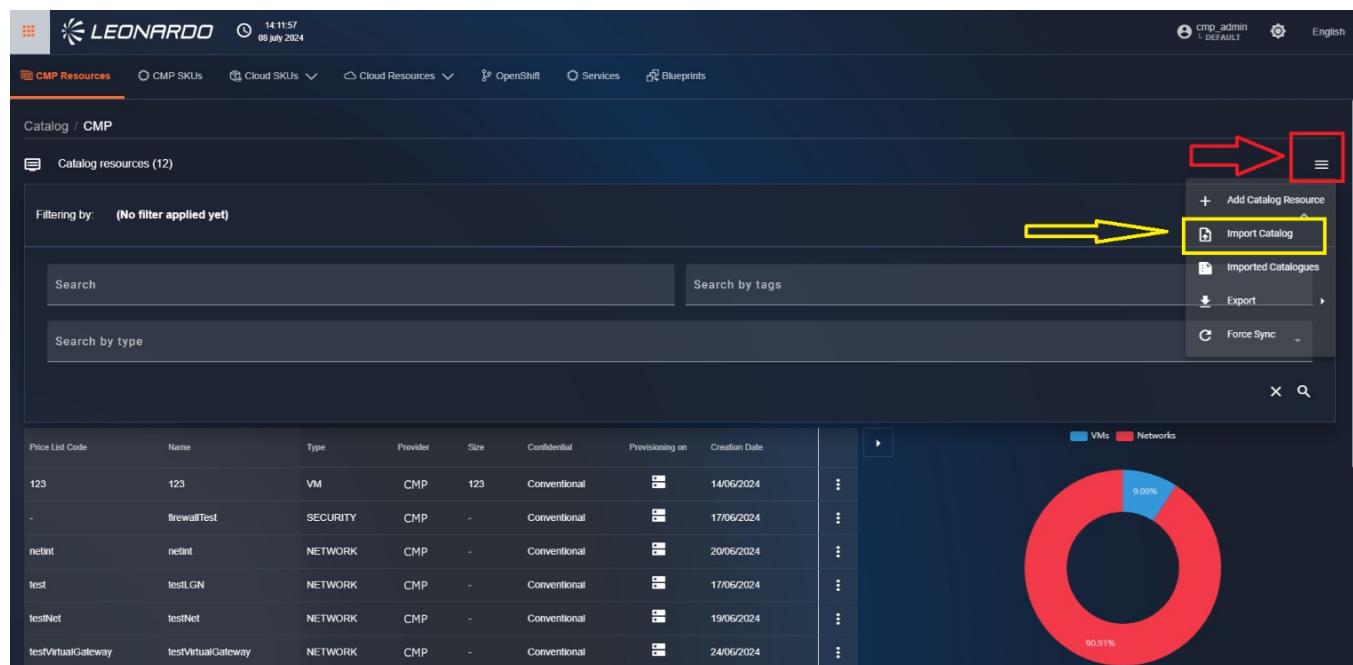

Figura 236 – Accesso all "Importazione pianificata del catalogo"

After clicking the button, a modal will open, containing two buttons:

- "Resources": clicking this button indicates to the system that the inserted price list will contain resources.
- "SKUs": clicking this button indicates to the system that the inserted price list will contain SKU items.

Once the resource type to be created is selected, the page updates to show all mandatory parameters.

Price List Code	Name	Type	Provider	Size	Confidential	Provisioning on	Creation Date	
123	123	VM	CMP	123	Conventional	<input type="button" value="..."/>	14/06/2024	<input type="button" value="::"/>
-	firewallTest	SECURITY	CMP	-	Conventional	<input type="button" value="..."/>	17/06/2024	<input type="button" value="::"/>
netint	netint	NETWORK	CMP	-	Conventional	<input type="button" value="..."/>	20/06/2024	<input type="button" value="::"/>
test	testLGN	NETWORK	CMP	-	Conventional	<input type="button" value="..."/>	17/06/2024	<input type="button" value="::"/>
testNet	testNet	NETWORK	CMP	-	Conventional	<input type="button" value="..."/>	19/06/2024	<input type="button" value="::"/>
testVirtualGateway	testVirtualGateway	NETWORK	CMP	-	Conventional	<input type="button" value="..."/>	24/06/2024	<input type="button" value="::"/>

Figura 237 – Scelta della tipologia di catalogo

Two parameters are present in the modal:

- Provider: Select the provider related to the price list that will be inserted.
- Valid From: It is possible to indicate a start validity date for the price list. On the day indicated in this variable, the system will automatically update the catalog resources to conform to the new price list.

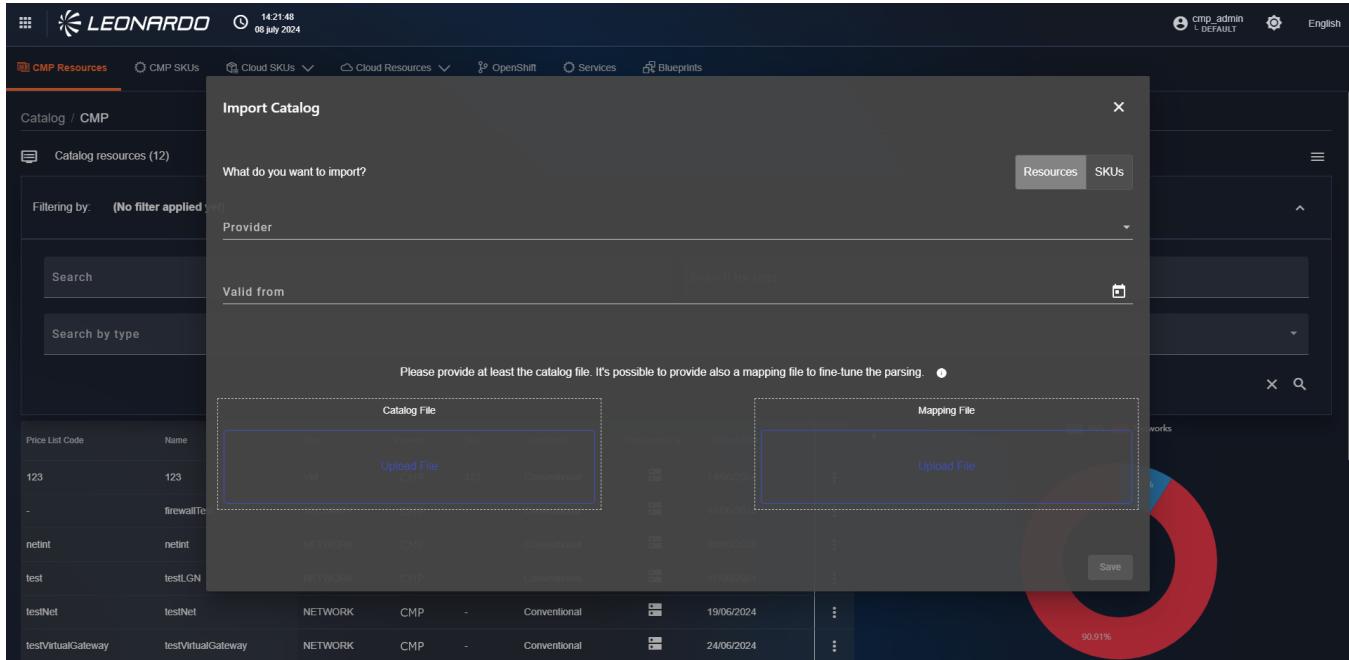

Figura 238 – Campi obbligatori per l'importazione

Furthermore, below the parameters, there are two sections for file upload. Clicking on the first square on the left will allow selecting an "XLS" file containing all the resources to be mapped. Clicking on the second square will allow inserting a mapping file, following the information shown in the "Help" section indicated with a "Question Mark" icon. Clicking on it will open a box, below the upload sections, containing all the information related to the mapping file to be inserted.

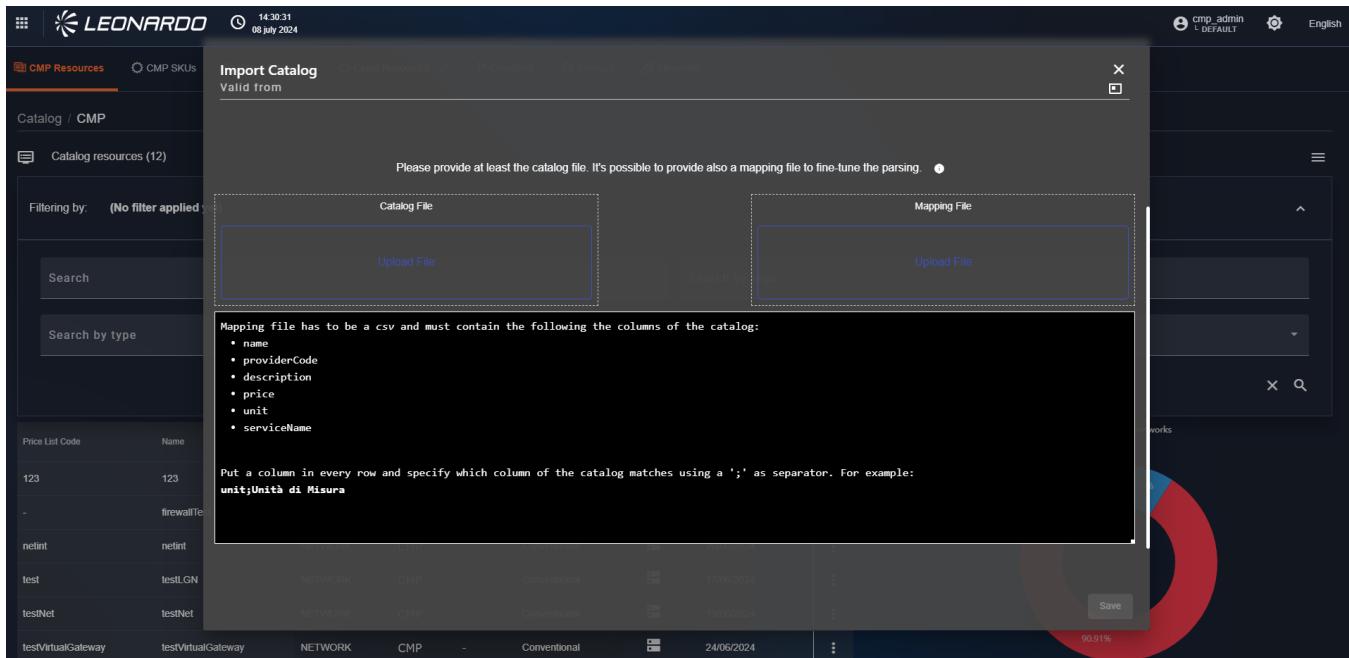

Figura 239 – Messaggio di aiuto per il file di Mapping

After entering all parameters, it will be possible to click the save button at the bottom, and we will be redirected to the imported catalogs management page, where it will be possible to monitor their insertion.

9.0.1.3.2 Import Management

To insert a new price list, it is necessary to click the "hamburger menu" available in the upper right corner of the catalog resources page and select "Imported Catalogues".

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there's a header with the Leonardo logo, the date (14:11:57 08 July 2024), and user information (cmp.admin). Below the header, the main navigation bar includes links for CMP Resources, CMP SKUs, Cloud SKUs, Cloud Resources, OpenShift, Services, and Blueprints. The main content area is titled "Catalog / CMP" and shows "Catalog resources (12)". A search bar and a "Search by type" dropdown are present. On the right side, there's a sidebar with options like "Add Catalog Resource", "Import Catalog", "Export", and "Force Sync". Two arrows point to specific buttons: a red arrow points to the "Import Catalog" button, and a yellow arrow points to the "Imported Catalogues" link. Below the sidebar, there's a table listing catalog resources with columns for Price List Code, Name, Type, Provider, Size, Confidential, Provisioning on, and Creation Date. To the right of the table is a donut chart showing resource distribution between VMs (9.09%) and Networks (90.91%).

Price List Code	Name	Type	Provider	Size	Confidential	Provisioning on	Creation Date	⋮
123	123	VM	CMP	123	Conventional		14/06/2024	⋮
-	firewallTest	SECURITY	CMP	-	Conventional		17/06/2024	⋮
netInt	netInt	NETWORK	CMP	-	Conventional		20/06/2024	⋮
test	testLGN	NETWORK	CMP	-	Conventional		17/06/2024	⋮
testNet	testNet	NETWORK	CMP	-	Conventional		19/06/2024	⋮
testVirtualGateway	testVirtualGateway	NETWORK	CMP	-	Conventional		24/06/2024	⋮

Figura 240 – Accesso ai cataloghi importati

The user will then be redirected to the page containing all previously imported catalogs. On this page, for each row, which corresponds to an Upload, it is possible to delete the file by clicking the "Three dots" button corresponding to the row and clicking "Delete" to remove it.

Catalogs can have 3 different states:

- Deleted: indicates that the file has been replaced with a subsequent version.
- Success: indicated with a green icon, indicates that the catalog is ready and will be used starting from the indicated day.
- In progress: indicated with a yellow icon, indicates that the system is checking the validity of the entered information.

On this page, we can also note that uploads made with the same file are saved using versions, so when an already existing catalog is inserted, it will be overwritten with a higher version, and previous versions will be deactivated.

Figura 241 – Lista dei cataloghi importati

Clicking on a "Success" row in the table will open a modal. Inside, we can view a summary that contains, in addition to basic information, the number of elements, called "rows", that were found in the Excel file.

The rows available in the file can have 3 different states:

- Associated Rows: indicates that the system is able to both create the resource and associate it with a provider catalog size, allowing its use during provisioning.
- Success Rows: indicates that the system is able to create the resource but cannot establish a relationship with a provider resource.
- Failed Rows: indicates that the system cannot insert the resource.

9.0.2 Provider Catalog Item Management

Within the Catalog Module, it is possible to view the list and details of the "sizes" available on the various providers configured on the SCMP for both individual resources (VM, STORAGE, NETWORK, SECURITY) and resource groups "SKU".

9.0.2.1 Resources

To view the list of resources available for a provider, select the "Cloud resources" menu (in red in the image) at the top and select one of the available providers (in yellow in the image). The functionalities available on the pages of the different providers are identical.

15 Dec 2025

09.00

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there's a navigation bar with links for 'CMP Resources', 'CMP SKUs', 'Cloud SKUs', 'Services', 'Blueprints', and language settings ('English'). Below the navigation is a breadcrumb trail 'Catalog / CMP' and a section titled 'Catalog resources (6)'. A yellow arrow points to the 'Catalog resources (6)' link. To its right, a red arrow points to a dropdown menu titled 'Cloud Resources' which contains a list of providers: Amazon Web Services, Azure, VCloud Director, Google, Azure Stack Hybrid Cloud, Azure Stack, Azure Stack HCI, Oracle, and VMWare. Below this is a search bar and a 'Search by type' dropdown. On the right side of the page, there's a circular pie chart with segments for 'VMs' (blue), 'Storage' (yellow), and 'Cluster Kubernetes' (green). At the bottom left, there's a URL: <https://cmp-sspa-dev3.westeuropa.cloudapp.azure.com/catalog/resources#>.

Figura 245 – Risorse del catalogo dei providers

9.0.2.1.1 Export of Provider Sizes

To export the list of Catalog resources displayed on the page, in the upper right corner, click on the hamburger menu, and then click on "Export".

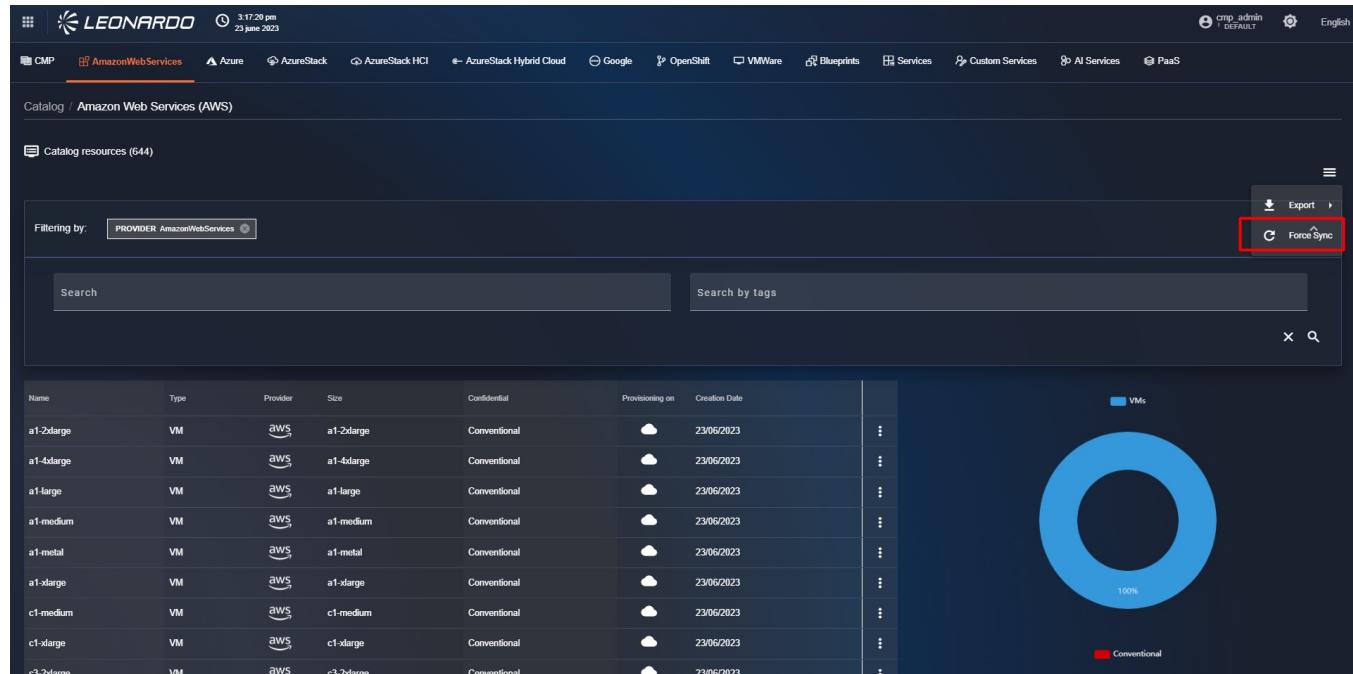

The operator will have the option to export the list of results in .csv and/or .json format.

The screenshot shows the Leonardo Secure Cloud Management Platform interface for the 'Amazon Web Services (AWS)' provider. At the top, there's a navigation bar with links for 'CMP', 'Amazon Web Services', 'Azure', 'AzureStack', 'AzureStack HCI', 'AzureStack Hybrid Cloud', 'Google', 'OpenShift', 'VMWare', 'Blueprints', 'Services', 'Custom Services', 'AI Services', and 'PaaS'. Below the navigation is a breadcrumb trail 'Catalog / Amazon Web Services (AWS)' and a section titled 'Catalog resources (644)'. A red box highlights the 'Export' button in the top right corner of the search/filter area. Another red box highlights the 'CSV' and 'JSON' buttons in the same area. To the right of the search bar is a circular pie chart with a single segment labeled 'VMs' at 100%. At the bottom left, there's a URL: <https://cmp-sspa-dev3.westeuropa.cloudapp.azure.com/catalog/resources?provider=AmazonWebServices>.

Figura 246 – Esportazione dei risultati

9.0.2.1.2 Forced Catalog and Cost Update Functionality

It is possible to force the system so that, after a few minutes, all "sizes" and their associated costs are automatically updated. To do this, click on the hamburger menu in the upper right corner, and then click on "Force Sync".

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there's a navigation bar with various cloud provider icons: CMP, AmazonWebServices, Azure, AzureStack, AzureStack HCI, AzureStack Hybrid Cloud, Google, OpenShift, VMware, Blueprints, Services, Custom Services, AI Services, and PaaS. The 'AmazonWebServices' icon is selected. On the left, a sidebar shows 'Catalog / Amazon Web Services (AWS)'. Below it, a search bar says 'Catalog resources (644)'. A 'Filtering by' dropdown is set to 'PROVIDER AmazonWebServices'. In the top right, there are 'Export' and 'Force Sync' buttons, with 'Force Sync' being the one highlighted with a red box. Below these buttons is a search bar with 'Search' and 'Search by tags' fields. The main area displays a table of AWS instance types with columns: Name, Type, Provider, Size, Confidential, Provisioning on, and Creation Date. The table includes rows for a1-2xlarge, a1-4xlarge, a1-large, a1-medium, a1-metal, a1-xlarge, c1-medium, c1-xlarge, and c3-2xlarge. To the right of the table is a donut chart showing 100% VMs and a small legend indicating Conventional. The entire interface has a dark blue theme.

Figura 247 – Funzionalità Force Sync

9.0.2.1.3 Resource Filters

The user is given the possibility to filter the displayed resource lists. At the top of the page, there is a filter section. The available filters are:

- "search": allows searching for resources with free text.
- "search by type": allows searching for resources of a specific type only.
- "search by tags" allows searching for all resources containing a specific tag.

After entering one or more filters, click the "magnifying glass" button to perform the search.

Size	a1-2xlarge
Update Date	23/06/2023

Properties

Tags & Notes

Costs

Figura 251 – Dettaglio Risorsa dal Modulo Catalog

The detail of a resource is divided into various sections:

- Details
- Properties
- Tags & Notes
- Cost

In the Cost section, it is possible to sequentially select the Region, Zone, and Cost type to obtain a preview of the costs related to the selected resource.

The screenshot shows the SCMP interface with the 'AmazonWebServices' tab selected. A modal window titled 'Show VM del Catalogo AWS' is open. The 'Cost Preview' section is highlighted with a red box. It contains dropdown menus for 'Region' (set to 'US East (N. Virginia)'), 'Zone' (set to 'Us-east-1b'), and 'Cost Type' (set to 'Reservation - Linux \$0.13 / 1 Hour').

Figura 252 – Sezione costi della risorsa

In the bottom right, click the "Close" button to return to the list.

9.0.2.2 “On-Premise” Resources

The management of resource catalogs in on-premise systems varies significantly, being specific to each system. In some cases, the catalog functionality is absent, while in others, it is available but does not allow automatic retrieval of resources.

The user is given the possibility to define a personalized "Cloud" catalog directly in the SCMP. In this way, it will then be possible to add the created resources to the relationships of "SCMP Catalog" resources.

To do this, it is first necessary to access the catalog resources tab of an on-premise provider. Specifically, we take "VMWare" as an example by selecting "VMWare" in the "Cloud resources" menu of the catalog module.

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there's a navigation bar with 'LEONARDO' and various resource categories like 'CMP Resources', 'Cloud SKUs', 'Services', and 'Blueprints'. Below the navigation is a sidebar titled 'Catalog / CMP' showing 'Catalog resources (28)'. A 'Filtering by' section indicates '(No filter applied yet)'. The main area displays a table of compute resources with columns for 'Price List Code' and 'Name'. To the right of the table is a donut chart showing the distribution of VMs and Networks, with 72.22% in blue and 27.78% in red. The bottom right corner features a large dashed circle with the text 'N/A'.

Figura 253 – Accesso al catalogo On-premise

On the page, in the upper right, above the filter bar, we find a contextual menu. Click on the "Three lines" icon and select "Add catalog resource". In this way, we will be redirected to the provider-specific page for creating the catalog resource.

This screenshot shows the 'Catalog / VMWare' page. The top navigation bar includes 'Cloud Resources', 'Cloud SKUs', 'Cloud Resources' (with a dropdown arrow), 'Services', and 'Blueprints'. The main content area shows a table with one row: 'No results found'. On the right side, there are download options for 'CSV' and 'JSON', and a 'Force Sync' button. A prominent red box highlights the '+ Add Catalog Resource' button in the top right corner of the page.

Figura 254 – Creazione nuova risorsa

At this point, the user is on the page where they can select the type of resource to create.

Figura 255 – Selezione del tipo di risorsa da creare

From the dropdown menu, select the type of resource to create. Then, click the "Next" button. You will be on the resource compilation page.

Figura 256 – Esempio di form per la creazione di una risorsa

On this page, after opening the available sections, enter all necessary parameters. In the "Cost" section at the bottom, it will be possible to add a customized price to associate with the resource. To do this, you need to select the billing interval (hourly, daily, weekly, monthly) and enter the cost related to the selected period on the right.

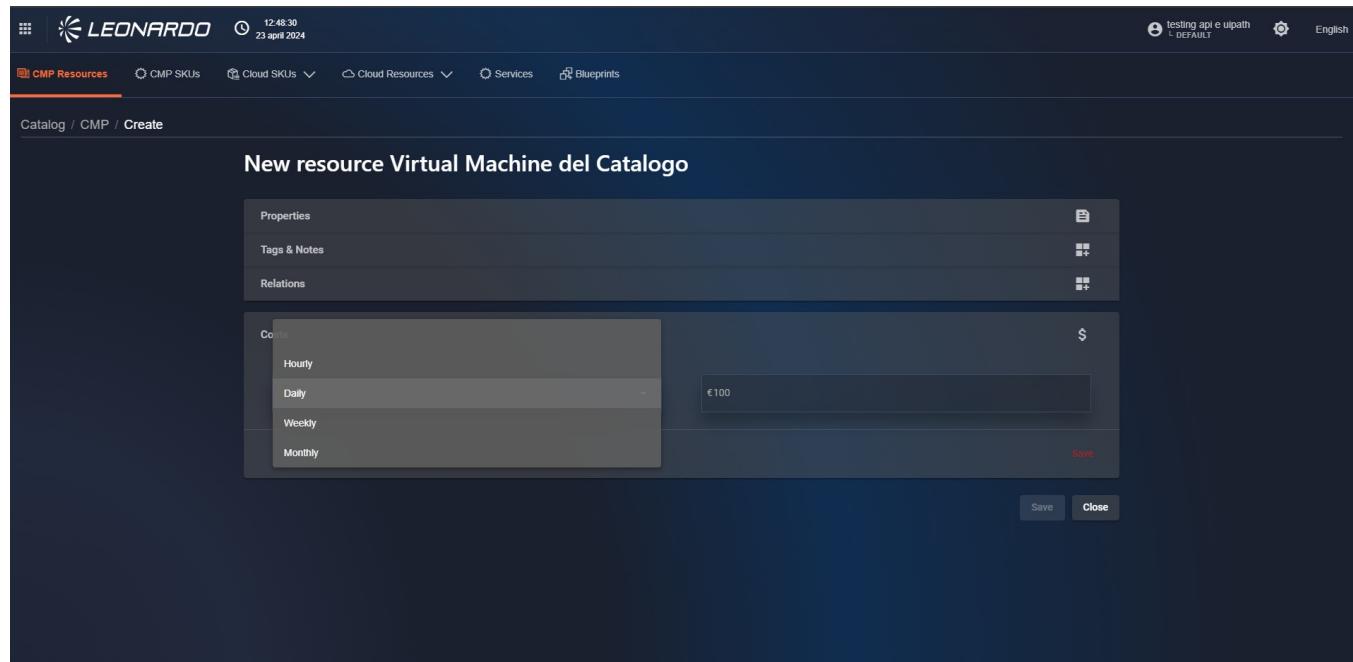

Figura 257 – Sezione costi delle risorse

9.0.2.3 Cloud SKU

To view the list of SKUs available for a provider, select the "Cloud SKU" menu (in red in the image) at the top and select one of the available providers (in yellow in the image). The functionalities available on the pages of the different providers are identical.

9.0.2.3.4 Catalog Resource Summary View

To view a preview of a resource, click on the record of interest for a resource. A modal will appear showing the general information of the identified resource, including: System, Name, Size, Update Date, service name.

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there's a navigation bar with links for CMP Resources, CMP SKUs, Cloud SKUs, Cloud Resources, Services, and Blueprints. The current view is under the 'Catalog / Azure SKUs' section, with a sub-link 'SKUs List (183)'.

A modal window is open, titled 'Sku del Catalogo Azure (v1.1)'. It contains the following details:

Details	
Name	100 RU/s
Service Name	Azure Cosmos DB - 100 RU/s - US West
System	Azure
Name	100 RU/s
Size	-
Update Date	17/04/2024 12:29:42

Below the modal, a table lists several Azure SKUs with their names, service names, creation dates, and more. One row is highlighted: '100 RU/s' with 'Azure Cosmos DB - 100 RU/s' and '17/04/2024'.

Figura 262 – Dettaglio rapido delle risorse di catalogo

9.0.2.3.5 Viewing Resource Details in the Catalog

To view the data of a resource, click on the kebab menu for a resource and then click on "Show". After doing this, the user is on the resource page in view mode, where they can see the data but cannot modify it.

The screenshot shows the Leonardo Secure Cloud Management Platform interface, specifically the 'Catalog / Amazon Web Services (AWS)' section. A modal window is open, showing a list of AWS resources. One resource, 'a1-2xlarge', has its 'Show' option highlighted with a red box in its kebab menu.

The table below lists various AWS instances with their names, types, providers, sizes, and creation dates. A pie chart in the bottom right corner shows the distribution of VMs by provider.

Name	Type	Provider	Size	Creation Date
a1-2xlarge	VM	aws	a1-2xlarge	23/06/2023
a1-xlarge	VM	aws	a1-xlarge	23/06/2023
a1-large	VM	aws	a1-large	23/06/2023
a1-medium	VM	aws	a1-medium	23/06/2023
a1-metal	VM	aws	a1-metal	23/06/2023
a1-large	VM	aws	a1-large	23/06/2023
c1-medium	VM	aws	c1-medium	23/06/2023
c1-large	VM	aws	c1-large	23/06/2023
c3-2xlarge	VM	aws	c3-2xlarge	23/06/2023
c3-4xlarge	VM	aws	c3-4xlarge	23/06/2023

Figura 263 – Accesso alla risorsa in modalità view

The screenshot shows a dark-themed web interface for managing cloud resources. At the top, there's a navigation bar with links for 'CMP Resources', 'CMP SKUs' (which is currently selected), 'Cloud SKUs', 'Cloud Resources', 'Services', and 'Blueprints'. The main area shows a breadcrumb path: 'Catalog / Google SKUs / View 661c770769797355c49a0fc4'. Below this, a modal window is open with the title 'Show Sku del Catalogo Google'. The modal contains a table with the following data:

Sku del Catalogo Google (v1.1)		Details	
System	Google	Name	1 Year Starter Pack
Name	1 Year Starter Pack	Service Name	MongoDB Atlas Starter
Size	-		
Update Date	17/04/2024 02:25:25		

Below the table, there are three tabs: 'Properties', 'Tags & Notes', and 'Costs'. The 'Costs' tab is currently active, showing a preview of costs. At the bottom right of the modal is a 'Close' button.

Figura 264 – Dettaglio Risorsa dal Modulo Catalog

The detail of a resource is divided into various sections:

- Details
- Properties
- Tags & Notes
- Cost

In the Cost section, it is possible to sequentially select the Region, Zone, and Cost type to obtain a preview of the costs related to the selected resource.

Figura 266 – Accesso ai "Services"

From the "SCMP" page, click on the tab that depicts three joined squares, 'Services', located above the breadcrumb path. After doing this, you will be on the 'Services' page, where a list of components called "Card" is displayed.

Each card refers to a specific type of service. Since there are many services, the system paginates them. At the bottom, we can use the "Item for page" field to display more results or use the arrows to navigate through the lists of services.

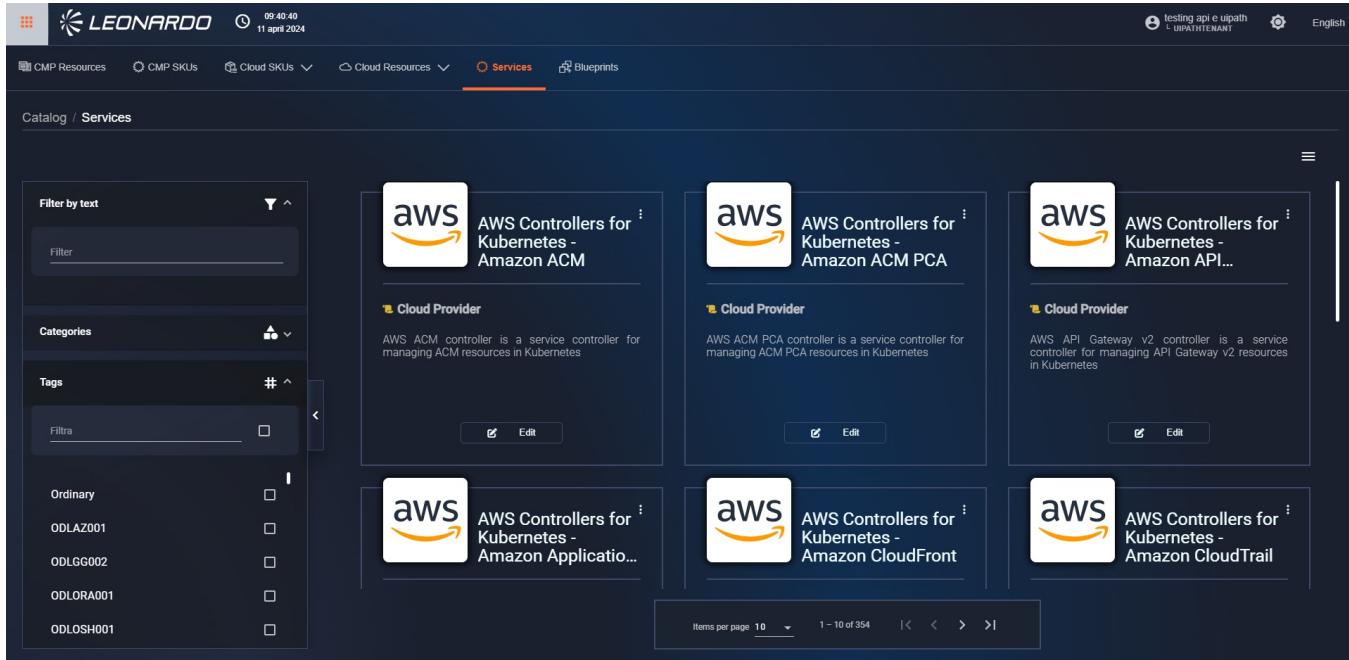

Figura 267 – Pagina dei servizi

9.0.3.1.1 “Services” Page Filters

To facilitate the user in searching for a specific service, a side filter section has been added to the page. Inside, we can find three combinable filters:

- "Filter by Text": by entering text in this field, the list of services will be updated to show services that include the entered text in their title or description (orange in the image).
- "Categories": it is possible to filter the list by one or more service categories. The category is manually entered during the service creation phase (green in the image).
- "Tags": it is possible to select one or more tags to display only services that have been configured with that tag (red in the image).

By using the filters in combination, it will be possible to display only the services that satisfy all specified conditions. In other words, the query will return only the services that match all set criteria.

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

Figura 268 – Filtri disponibili

9.0.3.1.2 Creating Services

From the "Services" page, the user can create a Service by accessing the appropriate section as shown in the figure.

Figura 269 – Accesso al form di creazione del Service

On the creation page, it is necessary to select a service type using the "Service Type" field to display its mandatory parameters.

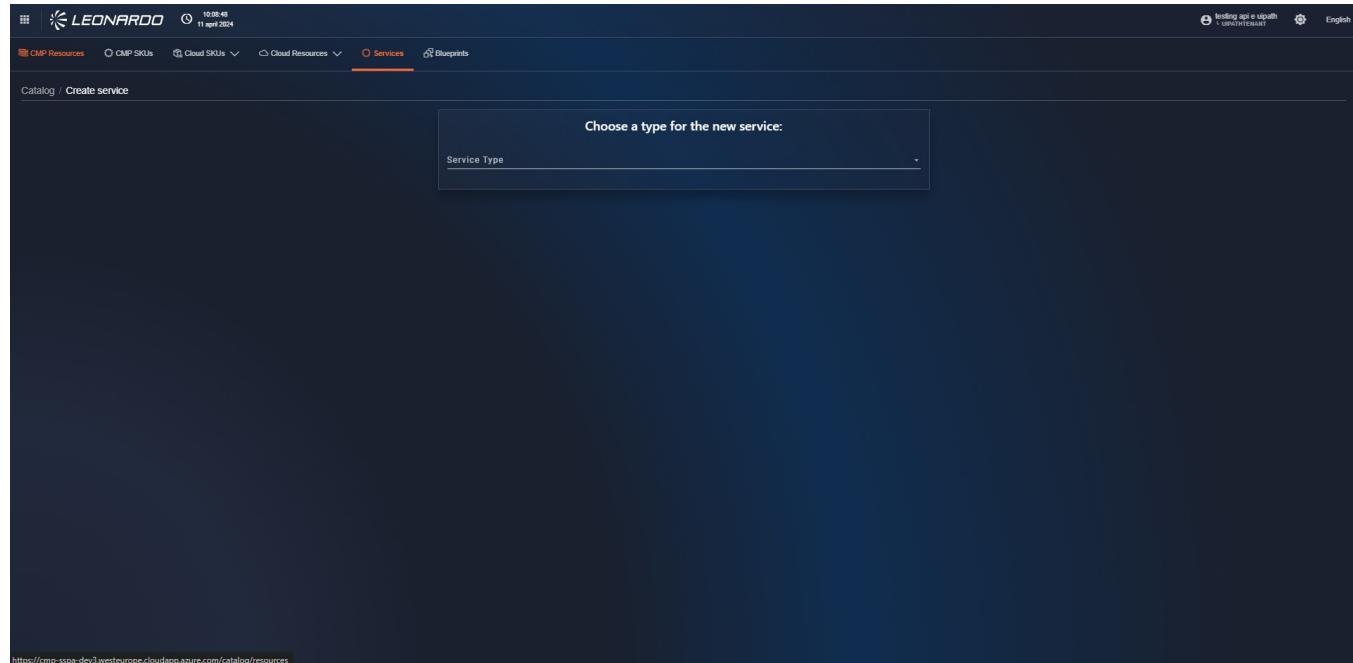

Figura 270 – Selezione della tipologia di servizio

In the following paragraphs, we will analyze the individual service types in detail.

9.0.3.1.2.1 “Standard” Services

The first type of services available for the SCMP are "Standard" services. These services are natively integrated into the system, and their operation cannot be modified by the user.

List of services offered:

- CosmosDb Cassandra SQL
- CosmosDb Core SQL
- CosmosDb Mongo
- Kafka 3.2.1 on Ubuntu 20.04 LTS
- Kafka 3.2.1 on Ubuntu 22.04 LTS
- Mongo DB 5.0 on Ubuntu 20.04 LTS
- Mongo DB 6.0 on Ubuntu 20.04 LTS
- Mongo DB 6.0 on Ubuntu 22.04 LTS

- MySQL DB 8.0 on Ubuntu 20.04 LTS
- MySQL DB 8.0 on Ubuntu 22.04 LTS
- PostgreSQL 14 on Ubuntu 20.04 LTS
- PostgreSQL 14 on Ubuntu 22.04 LTS
- Redis DB 7.0 on Ubuntu 20.04 LTS
- Redis DB 7.0 on Ubuntu 22.04 LTS

To insert a new service, it is necessary to fill in all fields in the properties section, specifically:

- "Categories": enter free text in the field and select an already configured category from the dropdown, or it is possible to add a new category by clicking the "+" button in the dropdown (orange in the page).
- "Name": the name of the service that will be displayed on the corresponding card.
- "Description": the description of the service that will be shown on the relative card.
- "Upload File": by clicking this control, it will be possible to select an "image" type file from your PC that will be displayed on the service card.
- "Related Software": in this section, you can select one or more "Standard" software that will then be used during provisioning.

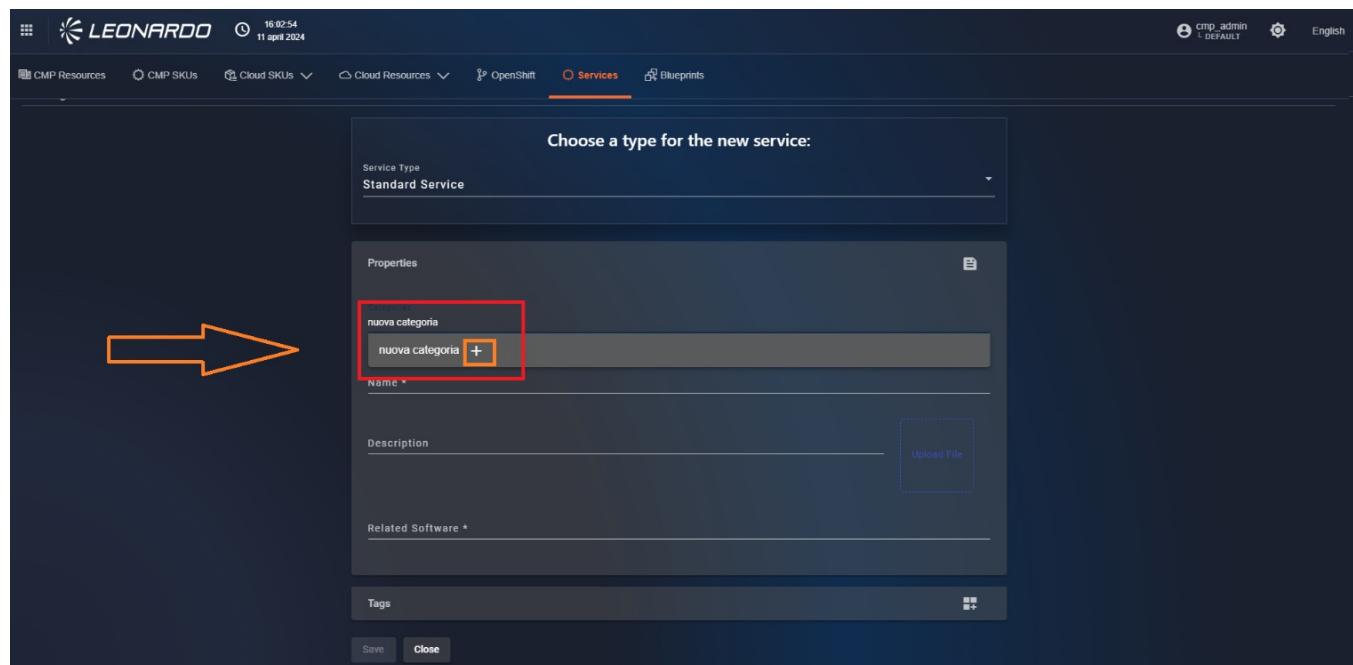

Figura 271 – Aggiunta nuova categoria

Once all data has been entered, the service can be saved using the "save" button in the bottom right. A confirmation modal will be displayed, and the user will be redirected to the list of available services.

9.0.3.1.2.2 "Custom" Services

The user is given the possibility to define "Custom" services by uploading a zip file containing all the necessary files for execution.

In this specific case, the SCMP system is only used to save the service and launch its execution, so it is not possible to check the correctness of the process, which will have to be managed by the user.

all are orchestrators, but with different functionalities and purposes:

1. Ansible:

- **Server and application orchestration:** Ansible automates the configuration and management of servers and applications across different platforms.
- **Executes YAML playbooks:** Ansible uses YAML playbooks to define instructions to be executed on servers.
- **Does not require an agent:** Ansible is agentless; it does not require software installation on the servers to be managed.

2. Bicep:

- **DSL language for Azure:** Bicep is an Azure-specific DSL that facilitates defining infrastructure as code.
- **Creates ARM templates:** Bicep translates files into ARM (Azure Resource Manager) templates that Azure uses to create resources.
- **Integrates with Azure DevOps:** Bicep integrates with Azure DevOps for lifecycle management.

3. Kubernetes:

- **Container orchestration:** Kubernetes is the leading platform for large-scale container orchestration.
- **Automates deployment and management:** Kubernetes automates the deployment, scaling, and management of containers in clusters.
- **Offers an ecosystem of tools:** Kubernetes offers a rich ecosystem of tools and libraries for container management.

4. Terraform:

- **Infrastructure as Code:** Terraform is an open-source tool for managing infrastructure as code.
- **Defines infrastructure in HCL files:** Terraform uses HCL configuration files to define the desired infrastructure.
- **Supports different providers:** Terraform supports a wide range of cloud and on-premise providers.

In summary:

- **Ansible:** Ideal for automating server and application configuration.
- **Bicep:** Great for defining infrastructure on Azure in a readable way.
- **Kubernetes:** Powerful tool for large-scale container orchestration.
- **Terraform:** Flexible for managing infrastructure across multiple cloud providers or on-premise.

In the configuration of "Custom" services, we can identify a common section composed of the initial parameters:

- "Categories": enter free text in the field and select an already configured category from the dropdown, or it is possible to add a new category by clicking the "+" button in the dropdown.
- "Name": the name of the service that will be displayed on the corresponding card.
- "Description": the description of the service that will be shown on the relative card.

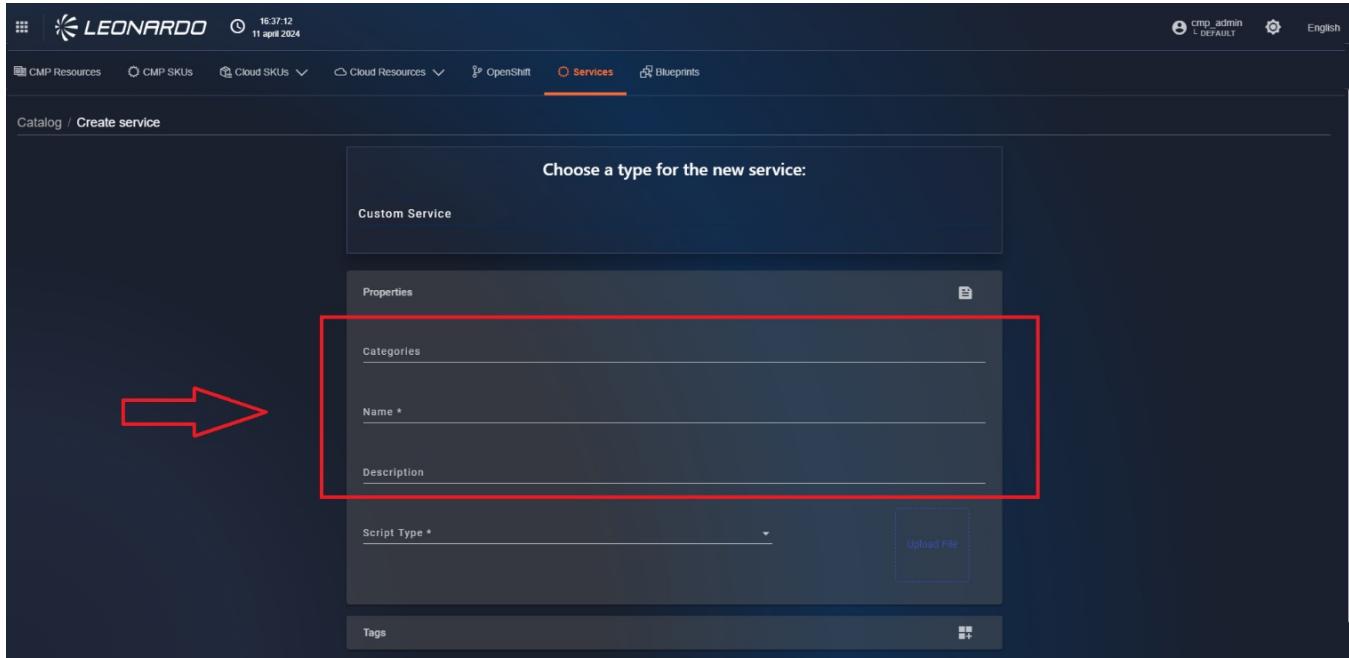

Figura 272 – Parametri generali dei "Custom Services"

Subsequently, it is necessary to choose the type of "orchestrator" to use and insert the corresponding ".zip" file in the "Upload File" section. The specifications for each type are indicated below:

Script type	Mandatory .zip file content
Ansible	Instance.yaml - Vars.yaml
Bicep	Main.bicep - Main.parameters.json
Kubernetes	Only .YAML files
Terraform	Main.tf - Variable.tf - Provider.tf

In addition to the files described in the table, it is possible to add a ".png / .jpg / .img" file to the zip that will then be used as the image for the corresponding Card.

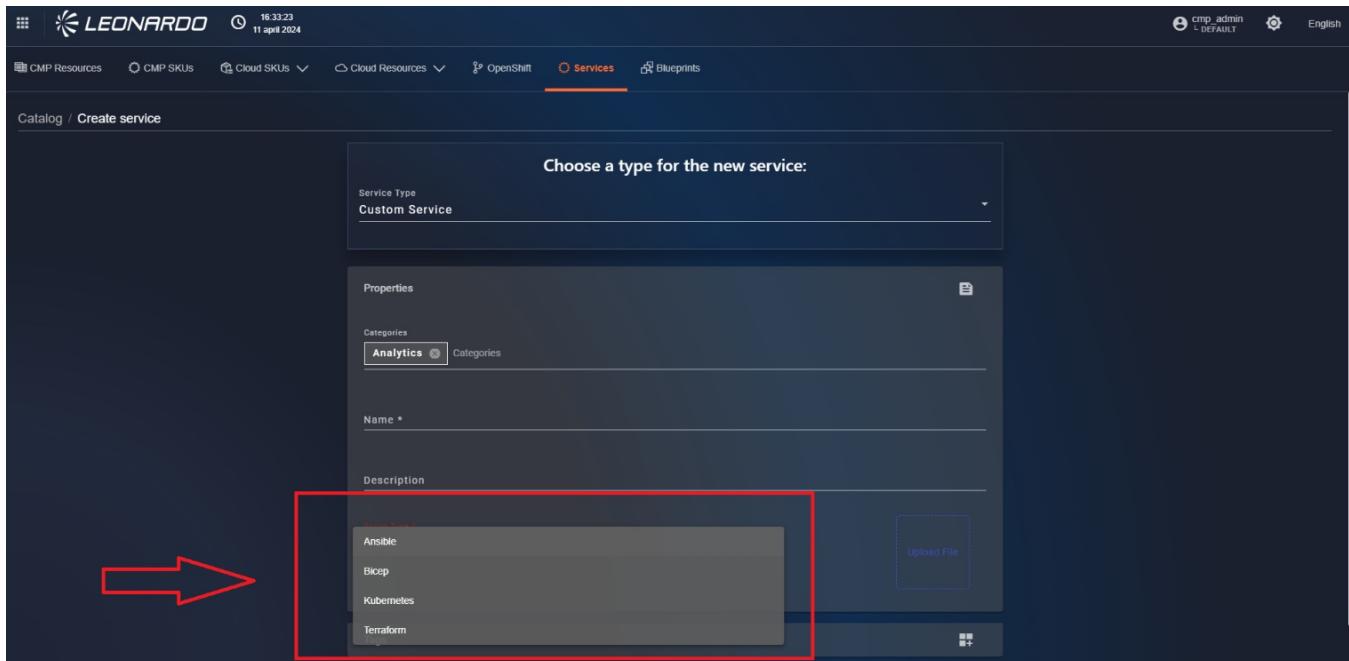

Figura 273 – Selezione della tipologia di Orchestratore

Once all data has been entered, the service can be saved using the "save" button in the bottom right. A confirmation modal will be displayed, and the user will be redirected to the list of available services.

9.0.3.1.2.3 “Azure Pipeline” Services

The user is given the possibility to define "Azure Pipeline" services. This type of service allows the SCMP to invoke the execution of a remote DEVOPS pipeline usable through the provisioning functionality.

In the configuration of "Azure Pipeline" services, we can identify a general section composed of the parameters:

- "Categories": enter free text in the field and select an already configured category from the dropdown, or it is possible to add a new category by clicking the "+" button in the dropdown. "Name": the name of the service that will be displayed on the corresponding card.
- "Description": the description of the service that will be shown on the relative card.

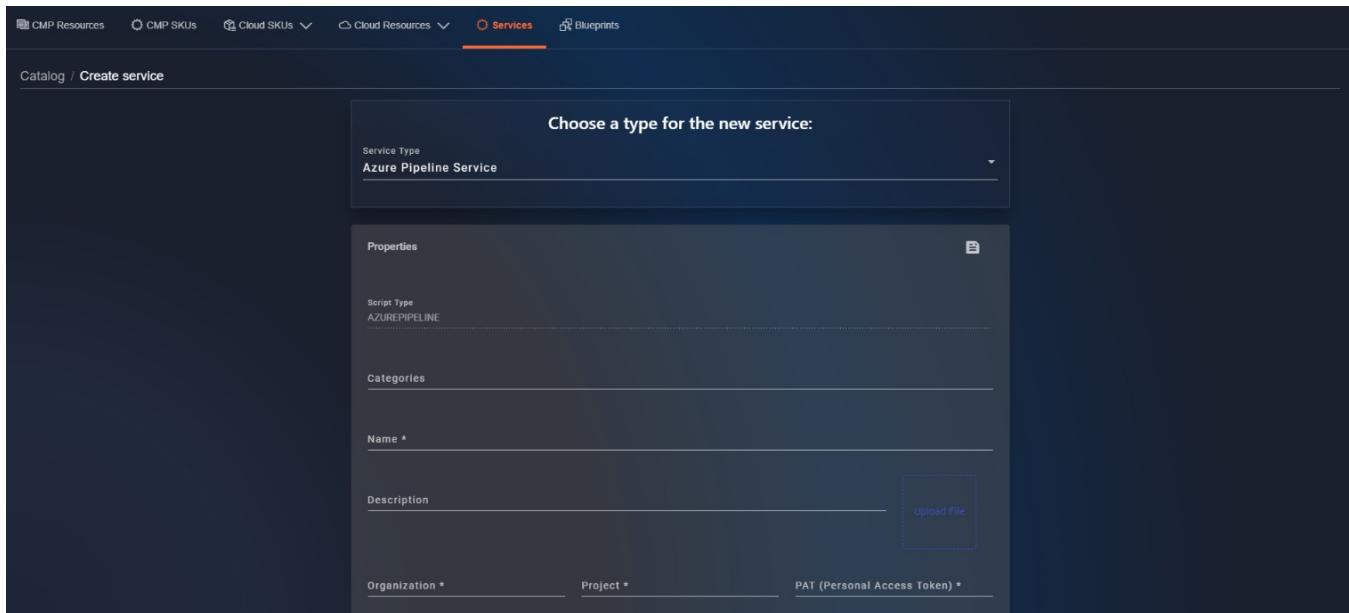

Figura 274 – Parametri generali "Azure pipeline service"

Also for this service, it will be possible, through the "Upload File" field, to insert a ".zip" file that contains a ".png / .jpg / .img" file within the zip, which will then be used as the image for the corresponding Card.

Subsequently, it will be necessary to fill in the specific parameters of the service, in particular, it will be necessary to insert:

- "Organization": the name of the DevOps organization where the pipeline resides.
 - "Project": the name of the DevOps project where the pipeline resides.
 - "PAT": the private personal access token generated from the "Azure DevOps" portal.
- Once these fields are filled, it is possible to click the "Test" button to verify the entered parameters.

If the entered data is not valid, various error messages will be displayed indicating which parameter is incorrect (e.g., "Specified Organization is not valid.") and the button will turn red with "KO" written. When all parameters are correct, the button will turn green with "OK" written.

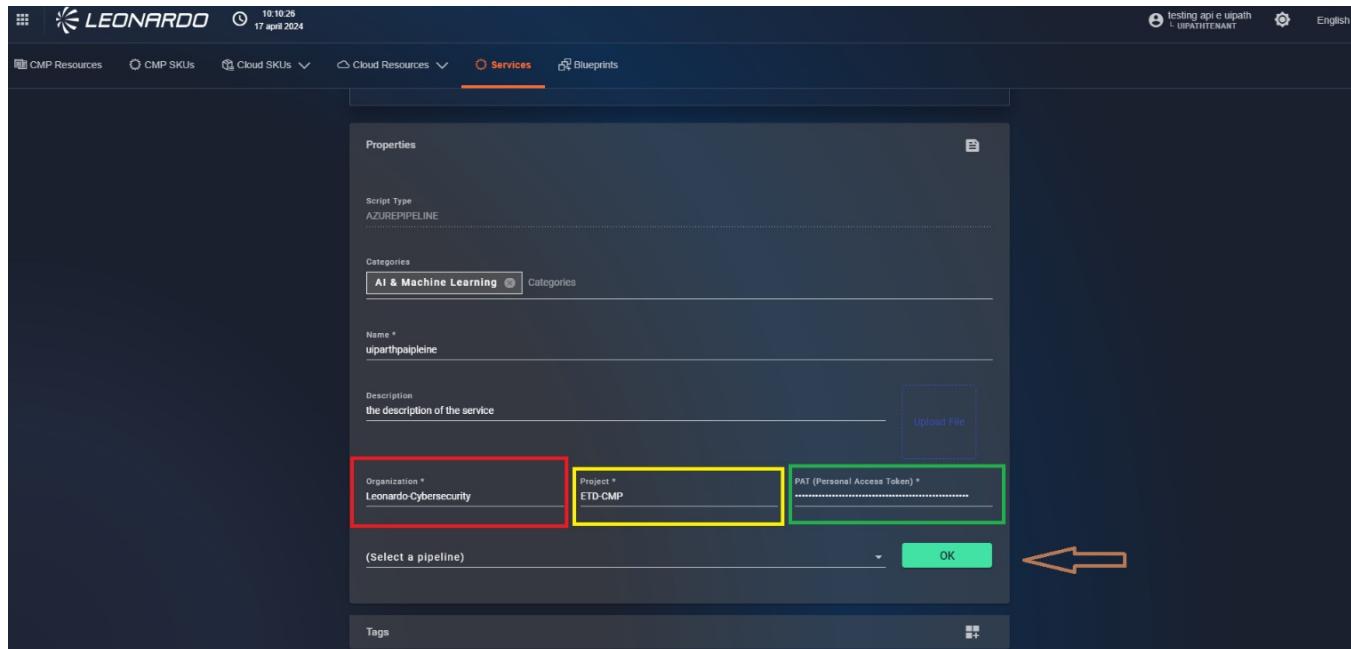

Figura 275 – Parametri specifici delle Pipeline

After successfully performing the test, it will be possible to select the pipeline to execute using the "Select Pipeline" field and clicking on an available option.

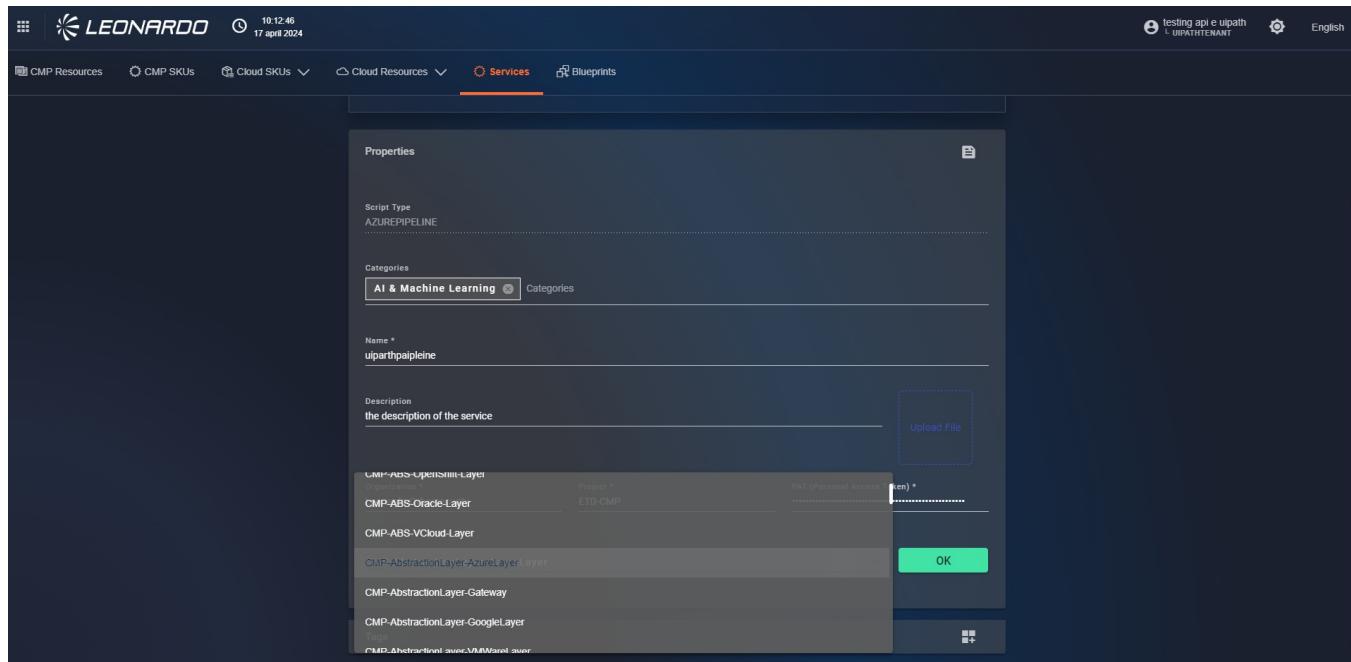

Figura 276 – Selezione della pipeline

Once all data has been entered, the service can be saved using the "save" button in the bottom right. A confirmation modal will be displayed, and the user will be redirected to the list of available services.

9.0.3.1.2.4 "HELM" Services

We can also configure "HELM" type services within the SCMP. For the configuration of these services, it is necessary to enter these parameters:

- "Categories": enter free text in the field and select an already configured category from the dropdown, or it is possible to add a new category by clicking the "+" button in the dropdown.
- "Chart name": the actual name of the HELM CHART that will be used.
- "Chart repository": the URL relative to the repository containing the HELM CHART to be used.
- "Repository username": if the repository indicated above is private, it will be necessary to provide a username to access the repository.
- "Repository password": if the repository indicated above is private, it will be necessary to provide the password for the user indicated above.
- "Chart version": indicates which version of the chart to use.
- "Cluster": indicates which cluster to install the application on.
- "Description": the description of the service that will be shown on the corresponding card.
- "Image": in this section, it is possible to insert a .png file that will be used as the service image on the interface.
- "Immutable": Selecting this flag during provisioning will prevent modification of settings, and the service will be automatically configured based on.
- "Namespace": enter the name for the namespace where the deployment should occur.
- "Name": the name of the service that will be displayed on the corresponding card.
- "Configurations": in this section, it is possible to upload the values.yaml file that will be used for provisioning.

Figura 282 – Accesso alle "Blueprint"

From the "SCMP" page, click on the tab that depicts three joined squares, 'Blueprint', located above the breadcrumb path. After doing this, you will be on the 'Blueprint' page, where the list of

blueprints configured in the system is displayed.

Name	Description	Creation Date	Status
AKS Cluster & Helm Release	AKS Cluster & Helm Release	08/02/2024 09:11:51	✓
Blueprint with manual intervention	-	16/02/2024 14:11:14	✓
Docker development environment	Ubuntu VM setup for container development	22/02/2024 09:53:31	✓
Only manual	Blueprint with human tasks only	13/03/2024 09:39:32	✓
Onboarding Pubblica Amministrazione Secure Public Cloud GCP	Procedura di Onboarding nuova PA su Secure Public Cloud Google	14/03/2024 12:13:38	✓
Declarative blueprint	Blueprint with topology definition, but no provisioning plan	28/03/2024 14:13:35	✓

Figura 283 – Pagina delle Blueprint

9.0.3.2.1 Adding a new blueprint

From the "Blueprint" page, the user can create a new blueprint by accessing the appropriate section as shown in the figure, by clicking the "hamburger menu" in the upper right corner and selecting "Add Blueprint".

Leonardo Cyber & Security Solutions

15 Dec 2025

09.00

Secure Cloud Management Platform

The screenshot shows a list of blueprints with columns for Name, Description, and Creation Date. The 'Blueprints' tab is selected in the navigation bar. The 'Add Blueprint' button is highlighted with a red box and an arrow.

Name	Description	Creation Date
manual	only manual	10/04/2024 08:09:07
name	dscr	10/04/2024 09:45:36
myBlueprintName	description	10/04/2024 09:46:13
isAnewName	descrizione32	10/04/2024 09:46:51

Figura 284 – Aggiunta nuova Blueprint

The user is redirected to step 1 of the "Blueprint" creation where all general information about the blueprint can be entered. After entering the data, click the "Save blueprint" button to save the blueprint draft. For details on the status, please refer to the next paragraph.

The screenshot shows the 'Add Blueprint' form with the 'Definition' step selected. The 'Name *' field is highlighted with a red box and an arrow. The form includes fields for Description, Name, Notes, Tier, and Version, along with a 'Build' button and a 'SAVE BLUEPRINT' button at the bottom.

Figura 285 – Blueprint step 1

A confirmation modal for insertion will open. Once "yes" is clicked to continue, the user will see step 2 of blueprint creation.

Clicking "No" will cancel the draft insertion.

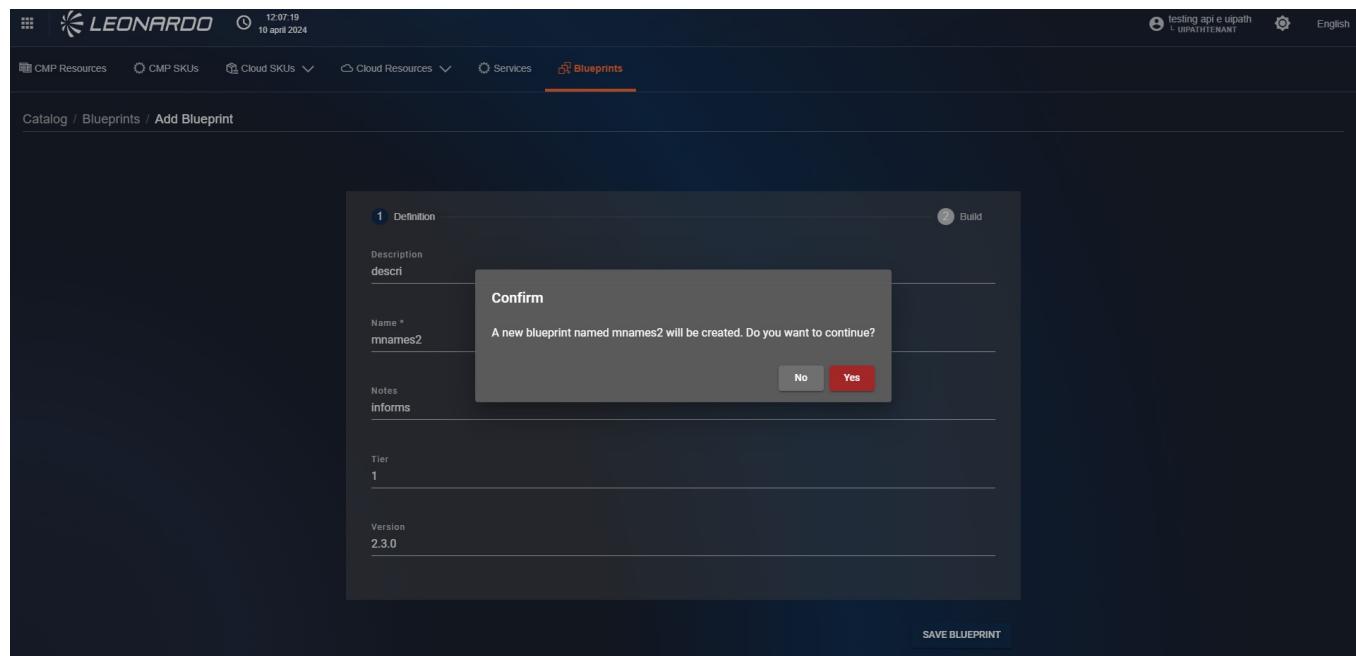

Figura 286 – Blueprint conferma della bozza

In step 2 of creating a Blueprint, it is necessary to click within the "Upload File" field and, using the Windows upload window, select the ".CSAR" file that contains the Blueprint.

After selecting a file, click the "Upload" button in the bottom right to start the file validation process, following the list of statuses in the paragraph below.

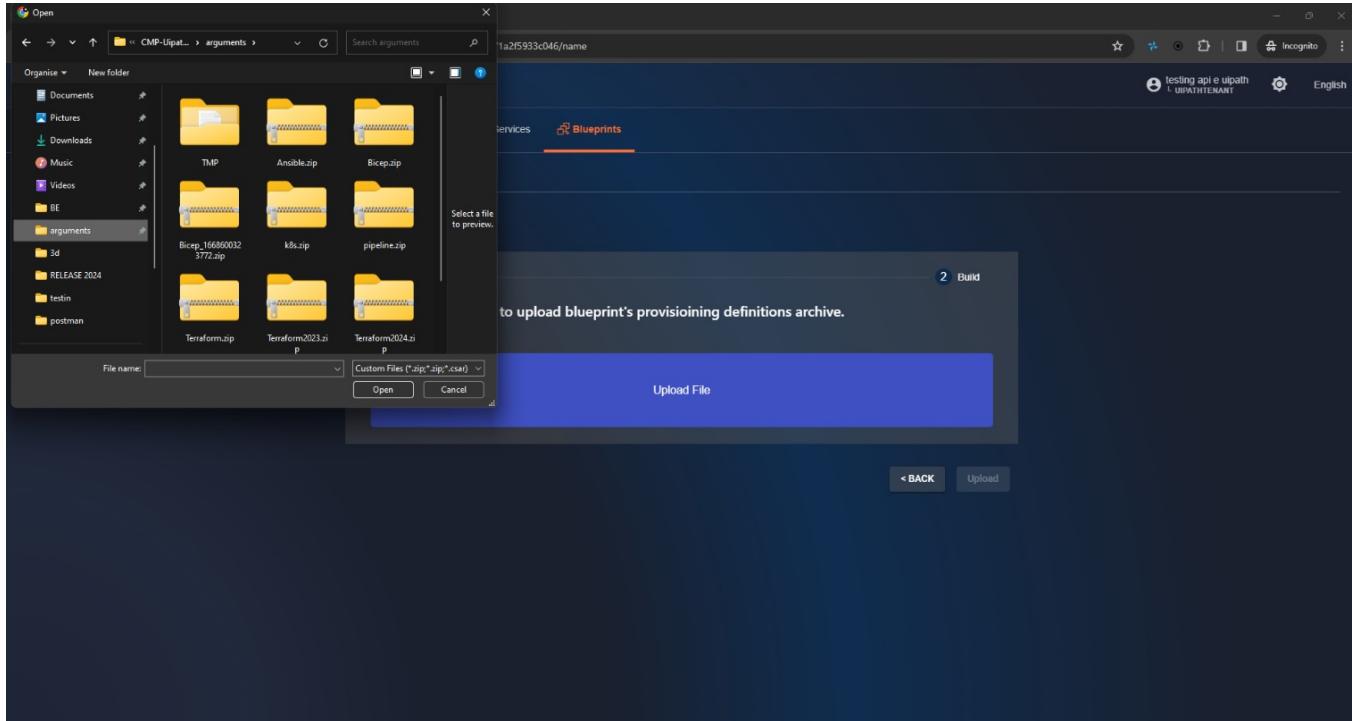

Figura 287 – Inserimento file

9.0.3.2.2 Blueprint Status

Since "Blueprints" are complex objects that must be properly configured, a file validation system has been implemented to allow the use of only "Blueprint" services that are correctly configured.

Specifically, there are 4 possible "STATUSES":

1. READY TO USE (green checkmark): indicates that the blueprint is configured correctly and can be used during "Provisioning".
2. VERIFY (yellow circle): indicates that the SCMP is validating the content of the Blueprint.
3. FAILED (red "X"): indicates that the uploaded file is not valid and must be re-entered by the user after correction.
4. DRAFT (orange): indicates that the "blueprint" has been created as a draft but does not contain the necessary CSAR file. Once the file is inserted, the blueprint will change to VERIFY status.

Name	Description	Creation Date	Status
manual	only manual	10/04/2024 08:09:07	
name	descr	10/04/2024 09:45:36	
myBlueprintName	description	10/04/2024 09:46:13	
isAnewName	descrizione32	10/04/2024 09:46:51	

Figura 288 – Status delle Blueprint

9.0.3.2.3 Viewing, Editing, and Deleting Blueprints

In the table of available blueprints, for each row, on the right, there is a contextual menu. Once opened, it contains three functionalities:

The "View" functionality: allows viewing the details of the blueprint. Once clicked, the user will be redirected to the blueprint viewing page.

- Properties: in this section, it is possible to modify the basic information of the blueprint (Figure 241).
- Provisioning plan: in this section, there is the bpmn graph which provides a graphical representation of the "steps" foreseen by the "Blueprint" (Figure 242). This section contains three buttons to modify the plan: the first, shaped like a "folder", allows uploading a new BPMN file to the edit page; the second, "download", allows downloading the currently displayed bpmn file; the third, on the right, "Upload", overwrites the current bpmn file available for the blueprint.
- Topology: The topology of a blueprint is the arrangement of components in a Kubernetes cluster. In this section, we can graphically visualize the system structure among different pods, services, and components (Figure 243).
- Update Model: in this section, it is possible to upload the CSAR file. By making this modification, the Blueprint will return to the "VERIFY" state to validate its content (Figure 244).

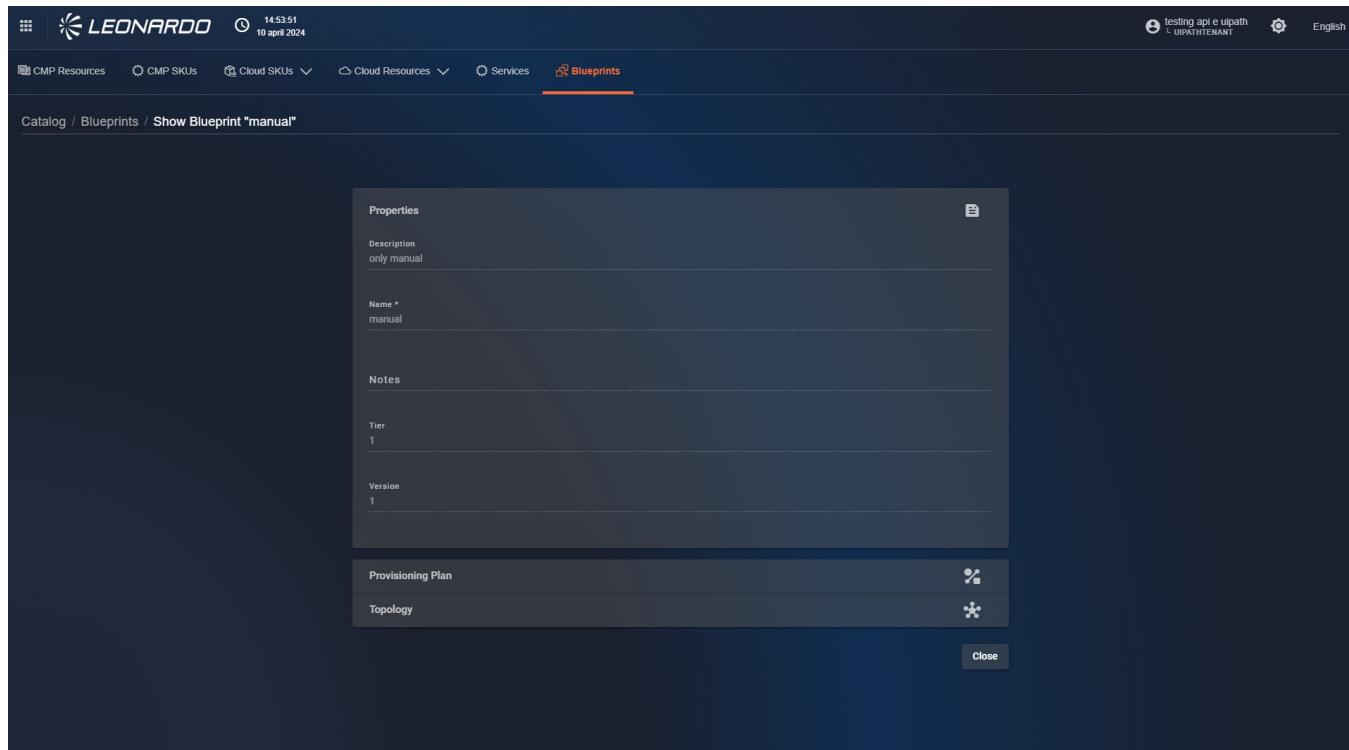

Figura 289 – Sezioni della pagina Blueprint "view"

The "Edit" functionality allows viewing and modifying all blueprint parameters, including the related CSAR file. It contains the following sections:

- Properties: in this section, it is possible to modify the basic information of the blueprint.
- Provisioning plan: in this section, there is the bpmn graph which provides a graphical representation of the "steps" foreseen by the "Blueprint". This section contains three buttons to modify the plan: the first, shaped like a "folder", allows uploading a new BPMN file to the edit page; the second, "download", allows downloading the currently displayed bpmn file; the third, on the right, "Upload", overwrites the current bpmn file available for the blueprint.
- Topology: The topology of a blueprint is the arrangement of components in a Kubernetes cluster. In this section, we can graphically visualize the system structure among different pods, services, and components.
- Update Model: in this section, it is possible to upload the CSAR file. By making this modification, the Blueprint will return to the "VERIFY" state to validate its content.

Secure Cloud Management Platform

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there is a navigation bar with links for CMP Resources, CMP SKUs, Cloud SKUs, Cloud Resources, Services, and Blueprints. The 'Blueprints' link is highlighted. Below the navigation bar, the URL 'Catalog / Blueprints / Edit Blueprint "isAnewName"' is visible. The main content area is titled 'Properties' and contains the following fields:

Description	descrizione
Name *	myblueprint
Notes	noted
Tier	1
Version	2

Below the properties section, there are two tabs: 'Topology' and 'Provisioning Plan'. The 'Topology' tab has a gear icon, and the 'Provisioning Plan' tab has a percentage icon.

Figura 290 – Sezioni della pagina Blueprint "edit"

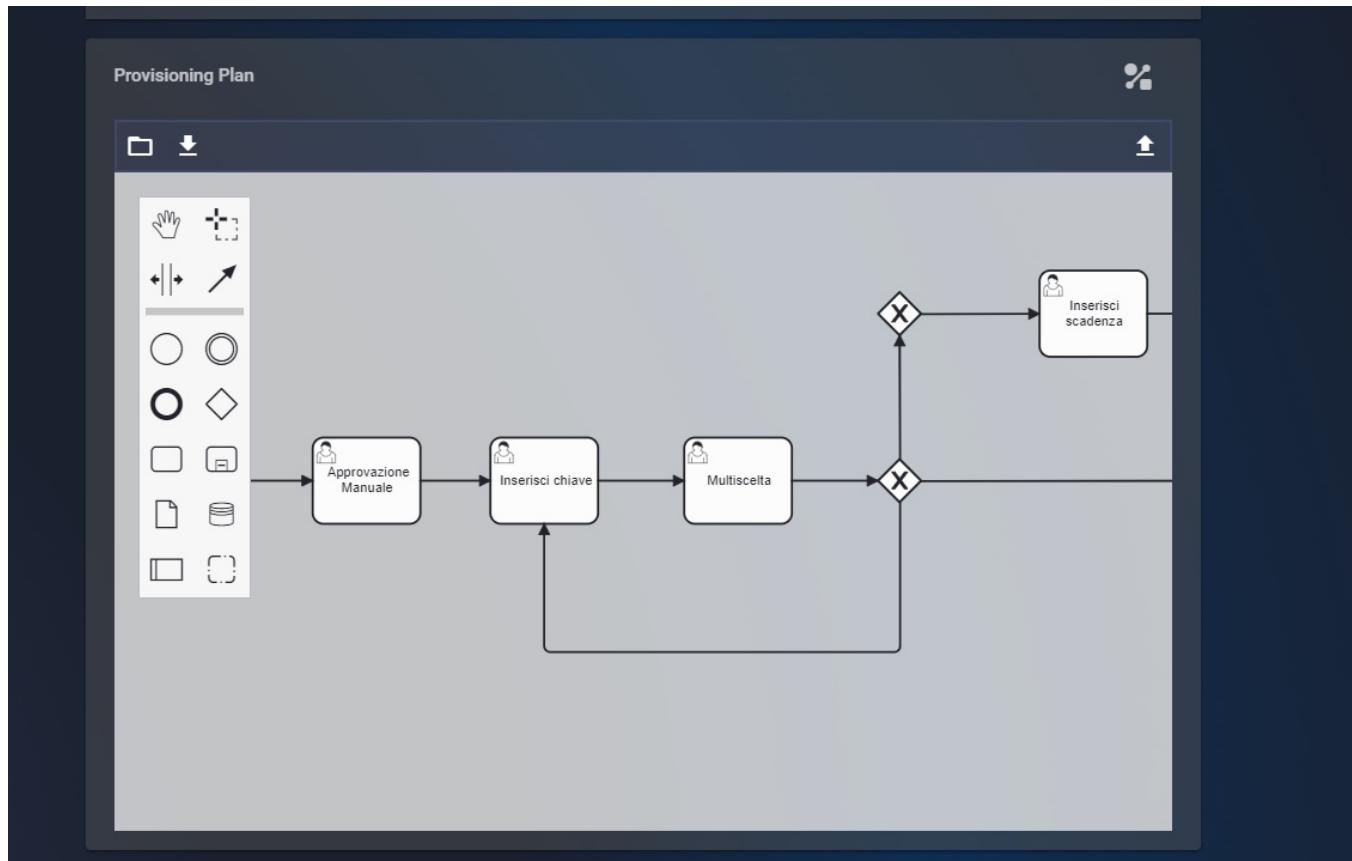

Figura 291 – Sezione Plan di una Blueprint

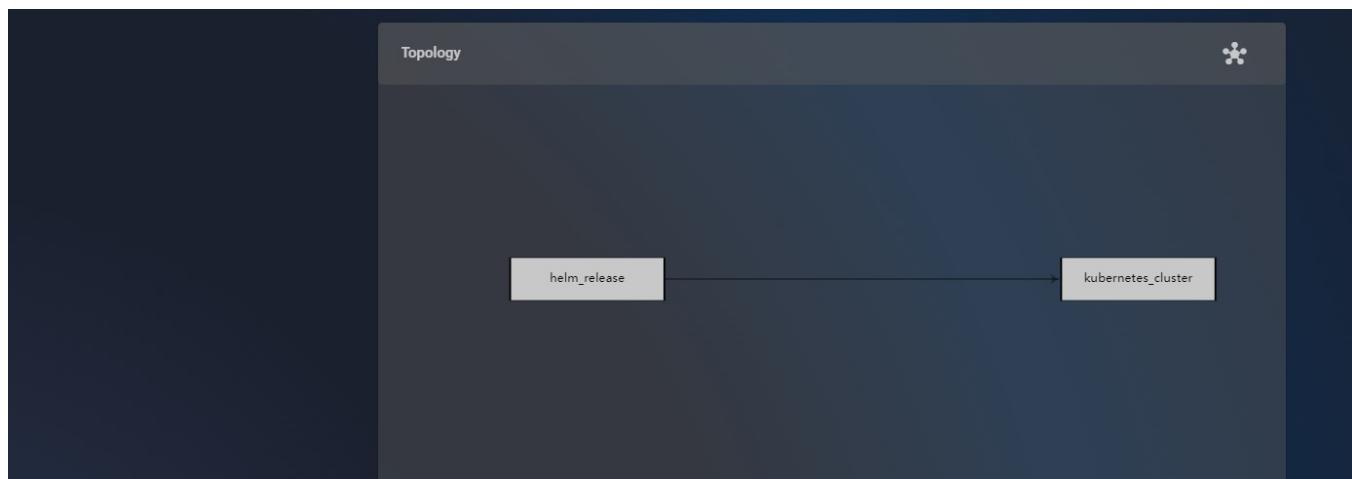

Figura 292 – Sezione Topology di una Blueprint

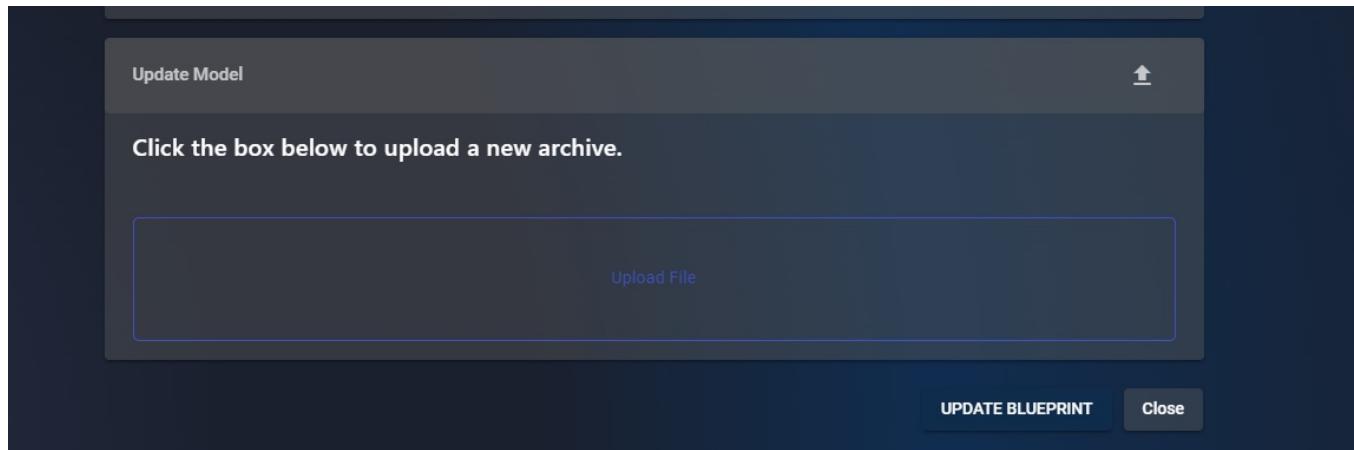

Figura 293 – Sezione Model di una Blueprint

The "Delete" functionality: allows permanently deleting the blueprint from the system. To do this, simply confirm the deletion by clicking the "Yes" button displayed in the deletion confirmation modal.

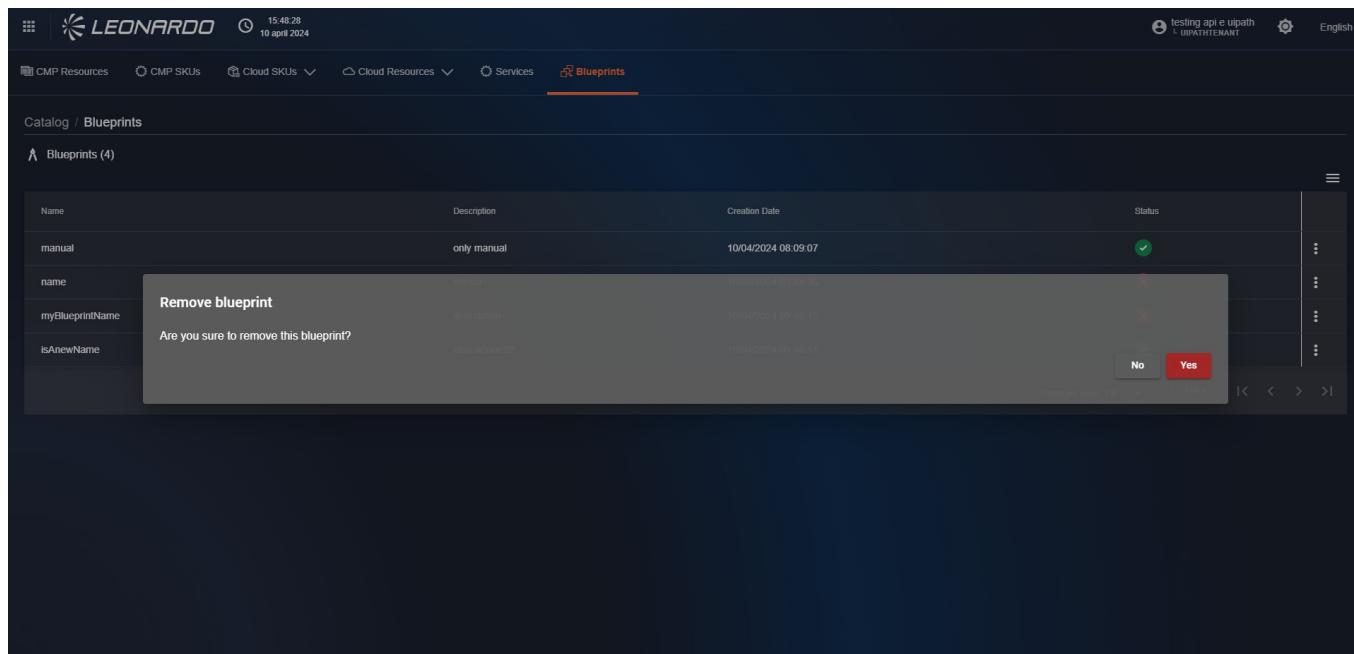

Figura 294 – Eliminazione di una Blueprint

9.0.4 Reporting Tools

The reporting functionality, specific to each feature, allows generating global reports of the information available for the various providers. Within the pages, the possibility will also be

given to create files to facilitate information sharing.

To access the functionality, above the breadcrumb path, click on the "Reports" tab.

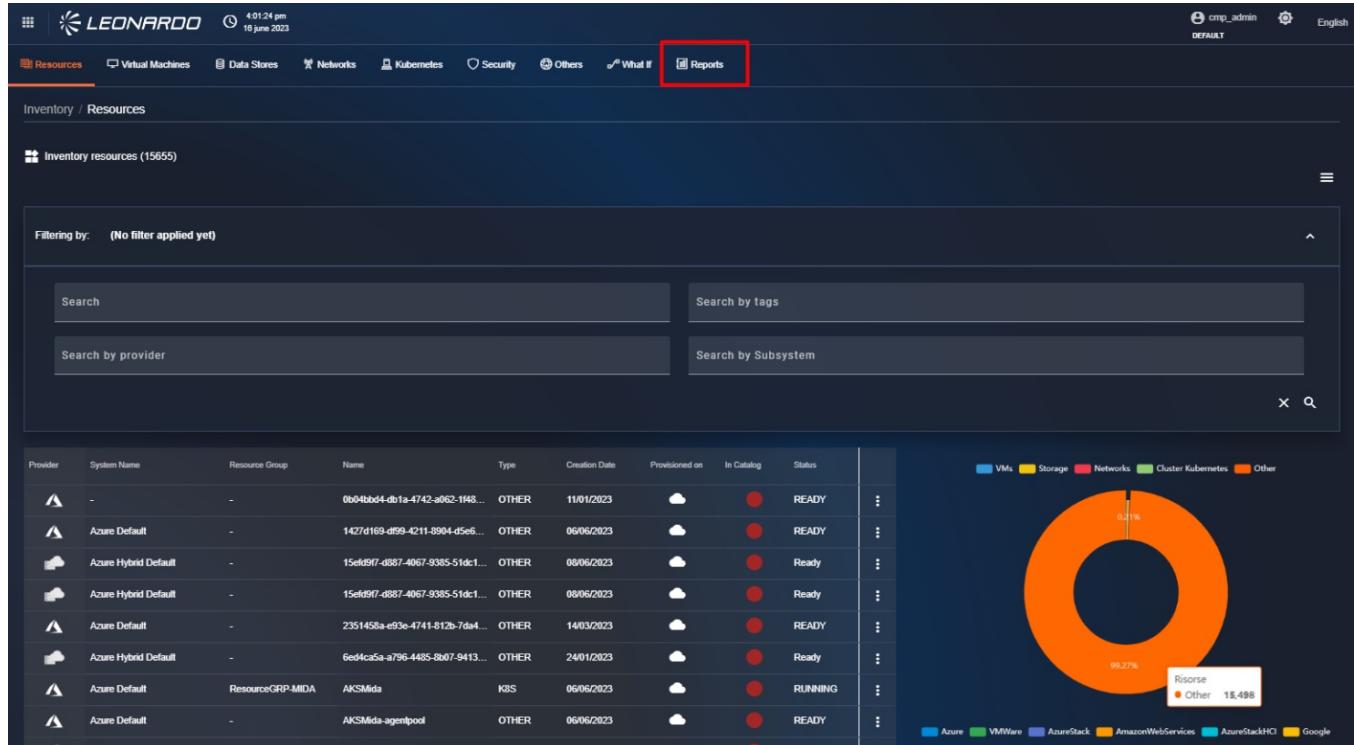

Figura 295 – Accesso al report di Catalogo

9.0.4.1 Available Report Types

CATALOG Missing SKU – List of provider SKUs not present in the SCMP catalog price list, if applicable. Consequently, the customer price for missing SKUs will be given by applying the discount/markup percentage configured in the Administration section.

9.0.4.2 Creating a Report

In the upper right of the page, we can click on the "New Report" button to start creating a report. Specifically, a modal will be displayed containing the list of available report types.

Sub Category	Provider	Creation Date	Status	Actions
SUMMARY	AZURE, GOOGLE, OPENSHIFT	2024 - 10:05 AM	READY	...
SUMMARY	AZURE, GOOGLE, OPENSHIFT	2024 - 10:01 AM	READY	...

SUMMARY	AZURE, GOOGLE, KUBERNETES, OPENSHIFT	03/06/2024 - 12:18 PM	READY	...
SUMMARY	AZURE, GOOGLE, KUBERNETES, OPENSHIFT	03/06/2024 - 12:07 PM	READY	...

Figura 296 – Creazione nuovo report

Once the report type is selected, click the "Configure" button to select the providers to include in the report. In the newly opened window, we find the "Provider" field which allows selecting one or more existing providers in the system. Subsequently, it is possible to select one or more subsystems to include in the report. If no providers are selected, no subsystem can be selected. Finally, there is a "tag" section to include only resources that have the entered tag.

The screenshot shows a dark-themed web interface for cloud management. At the top, there's a navigation bar with tabs like 'Resources', 'Virtual Machines', 'Data Stores', 'Networks', 'Clusters', 'Security', 'Others', 'What If', and 'Reports'. The 'Reports' tab is currently selected. Below the navigation, there's a sub-menu 'Inventory / Reports' and a title 'Reports'. On the left, there's a sidebar with 'Ready' and 'Scheduled' sections, listing various cloud resources. The main area displays a table of reports with columns for 'Status' (all listed as 'READY') and 'Actions'. A modal window titled 'Inventory' is open in the center, containing fields for 'Provider' (set to 'Azure, Google'), 'Subsystem' (set to 'MAE LAB, CMPPROJECT-374610'), and 'Tags'. At the bottom of the modal, there's a 'Report Type' section with radio buttons for 'One-Shot' (selected) and 'Recurring', and a prominent red 'Submit' button.

Figura 297 – Configurazione del report

At this point, the user can choose between two different actions:

- Create a static report that will be saved in the system.
- Schedule a recurring report generation.

To confirm the creation of a static report, verify that "One-Shot" has been selected for the "Report type" field and click the "Submit" button at the bottom.

After a loading period, the newly generated report will be visible in the list.

The screenshot shows a table of generated reports. The columns are Sub Category, Provider, Creation Date, Status, and Actions. The data includes:

Sub Category	Provider	Creation Date	Status	Actions
SUMMARY	AZURE, GOOGLE	12/06/2024 - 1:21 PM	READY	⋮
SUMMARY	AZURE	12/06/2024 - 12:29 PM	READY	⋮
SUMMARY	AZURE	12/06/2024 - 12:28 PM	READY	⋮
SUMMARY	AZURE, GOOGLE, OPENSHIFT	10/06/2024 - 10:05 AM	READY	⋮
SUMMARY	AZURE, GOOGLE, OPENSHIFT	10/06/2024 - 10:01 AM	READY	⋮
SUMMARY	AZURE, GOOGLE, OPENSHIFT	10/06/2024 - 8:32 AM	READY	⋮
SUMMARY	AZURE, GOOGLE, OPENSHIFT	10/06/2024 - 8:20 AM	READY	⋮
SUMMARY	AZURE, GOOGLE, OPENSHIFT	10/06/2024 - 12:30 AM	READY	⋮
SUMMARY	AZURE, GOOGLE, OPENSHIFT	07/06/2024 - 12:30 AM	READY	⋮
SUMMARY	AZURE, GOOGLE, OPENSHIFT	06/06/2024 - 12:29 AM	READY	⋮
SUMMARY	AZURE, GOOGLE, OPENSHIFT	05/06/2024 - 12:29 AM	READY	⋮
SUMMARY	AZURE, GOOGLE, OPENSHIFT, OPENSHIFT	04/06/2024 - 12:29 AM	READY	⋮

Figura 298 – Lista dei report effettuati

9.0.4.2.1 Report Scheduling

If, on the other hand, you want to schedule automatic report execution, you will need to select "Recurring" for the "Report Type" field. In this case, the window will update to show additional parameters for configuring the periodic report.

The parameters to be entered are:

- Period: allows selecting the frequency of report delivery (hourly, daily, ...).
- "Receive only if not empty" if selected, the file will not be sent if it contains no information.
- Report Language: allows selecting the language used in the report.
- File format: allows selecting one or more file types to include in the email.
- User E-mails: allows entering an email to which reports will be sent. After entering an email, it is necessary to press "Enter" on the keyboard to confirm its entry. Once pressed, the newly entered email will move to the bottom box, and the field will be cleared to allow the entry of a new email, if necessary.

The screenshot shows the 'Costs' report configuration dialog. It includes fields for 'Report Type' (One-Shot or Recurring), 'Period' (with dropdown options like 'Last 7 days', 'Last 30 days', etc.), 'Report's language' (Italian), 'File format' (Costs Details - Group By Resource), and 'User E-mails' (FinOps Report). A text area at the bottom says 'Press ENTER for each email you want to confirm and add to the list of recipients. It's possible to add multiple emails.' To the right, a preview table shows several rows of data with columns for 'Status' (READY) and 'Actions' (three dots).

Figura 299 – Parametri dei report schedulati

Having configured all parameters, the "Submit" button will become clickable. Click it to confirm the entry, and after a loading period, the newly generated report will be visible in the list.

Sub Category	Provider	Creation Date	Status	Actions
SUMMARY	AZURE, GOOGLE	12/06/2024 - 12:21 PM	READY	⋮
SUMMARY	AZURE	12/06/2024 - 12:29 PM	READY	⋮
SUMMARY	AZURE	12/06/2024 - 12:28 PM	READY	⋮
SUMMARY	AZURE, GOOGLE, OPENSHIFT	10/06/2024 - 10:05 AM	READY	⋮

SUMMARY	AZURE, GOOGLE, OPENSHIFT	07/06/2024 - 12:30 AM	READY	⋮
SUMMARY	AZURE, GOOGLE, OPENSHIFT	06/06/2024 - 12:29 AM	READY	⋮
SUMMARY	AZURE, GOOGLE, OPENSHIFT	05/06/2024 - 12:29 AM	READY	⋮

Figura 300 – Lista dei report effettuati

9.0.4.2.2 List of Scheduled Reports

To view the list of scheduled reports, select the "Scheduled" tab in the upper left of the reports page.

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there's a navigation bar with various icons and links like 'Resources', 'Virtual Machines', 'Data Stores', 'Networks', 'Clusters', 'Security', 'Others', 'What If', and 'Reports'. The 'Reports' link is highlighted with a red underline. Below the navigation, there's a sub-menu for 'Inventory / Reports' with a 'Reports' icon. The main area is titled 'Reports' and has a sub-section titled 'Scheduled'. Under 'Scheduled', there's a table with one row. The columns are 'Period' (set to 'Hourly'), 'Language' (set to 'EN'), 'Recipients' (showing 'noame@gmail.com'), and 'Last sent' (showing '12/06/2024 - 1:21 PM'). On the far right of each row is a 'Actions' column with a three-dot menu icon. At the bottom of the table, there are pagination controls for 'Items per page' (set to 20), '1 - 1 of 1', and navigation arrows.

Figura 301 – Lista dei report schedulati

On this page, you will find the list and related information of the scheduled reports present in the system. For each result, it is possible, by clicking the "Three dots" button on the right, to perform three operations:

- View the last generated report.
- Edit the schedule settings; it will not be possible to modify the selected providers or subsystems.
- Delete the schedule to stop sending emails.

Figura 302 – Modifica di una schedule

9.0.4.2.3 Using Reports

Clicking on a row of a static report, or using the "Show report" button available for scheduled reports, will display the detail page of the selected report.

In the summary of the Inventory report, there is a "Stats" section which contains the number of disks, interfaces, networks, and virtual machines belonging to the selected provider.

Below the "Stats" section, there are the filters used by the user to generate the report.

Below the filters, there is a summary table of resources belonging to the providers. On the right, there are two buttons: "PRINT" and "EXPORT".

Clicking the "PRINT" button, a print preview modal appears. To print the report, click the "Print" button in the bottom right, at which point the printing of said report will begin.

Clicking the "EXPORT" button, it is possible to export the report in ".csv", ".json", or ".pdf" format.

To return to the "Results" tab, in the bottom right, click the "CLOSE" button or in the upper left, click the left-pointing arrow, next to the report title.

The screenshot shows a dashboard titled "Report Inventory Summary". At the top, there's a stats summary with five boxes: 1 VMs, 1 Disks, 1 Networks, 0 Interfaces, and 0 K8Ss. Below this, a table lists providers and their subsystems with their respective counts of VMs, Disks, Networks, Interfaces, and K8Ss. The table includes columns for Type Provider, Subsystem Name, VMs, Disks, Networks, Interfaces, and K8Ss.

Type Provider	Subsystem Name	VMs	Disks	Networks	Interfaces	K8Ss
Azure	MAE LAB	14	16	14	0	0
Google	CMPPROJECT-374610	1	1	1	0	0

Figura 303 – Dettagli dei report

Cost and Usages

SCMP collects, through the APIs made available by the providers, the cost details of inventory assets.

In the event that providers do not expose cost data, this data can be editorially entered into the catalog so that it can then be counted within this functionality.

Costs are collected with a breakdown by daily cost and by resource. Subsequently, as with the metrics section, the data is normalized and aggregated to allow for a uniform dashboard visualization.

Attention

As also indicated on the cost dashboards, data related to the last 48 hours has not yet been confirmed by the respective providers. We can use this table as a reference, but for details, it is necessary to check the

specific provider's documentation.

For example:

Cloud Provider	Tool/Method	Update Times	Notes
Azure	Cost using export file	6/7 days	in the first 6 days of the following month, the costs of the previous month are consolidated
Azure	Cost Management	8-24 hours	Consolidated data updated within 24/48 hours; greater delay compared to others.
Google Cloud	Billing Dashboard	A few hours, maximum 24 hours	Near real-time updates; consolidation up to 24 hours.
Google Cloud	BigQuery Export	Every hour	Minimum delay for advanced analysis via BigQuery.

Cloud Provider	Tool/Method	Update Times	Notes
Oracle Cloud	Cost Analysis	4-6 hours, maximum 24 hours	some services may have greater delays.
AWS	Cost Explorer	8-24 hours	Aggregated data updated within 12-24 hours.
AWS	Cost and Usage Reports (CUR)	8-24 hours	Detailed reports with similar delay.
AWS	CloudWatch Metrics (Billing)	Every 6 hours	Near real-time monitoring.
AWS	Budget Alerts	3-5 hours	Rapid notifications when budget thresholds are exceeded.

Cost Dashboard

To access the cost section, use the menu as shown in the figure.

Figura 304 – Access to Costs

At this point, the user will find themselves within the "Dashboard" tab page of costs. On this screen, we can note in order:

- The "Cost trend" value, which indicates the total costs for the selected period.
- The "Cost difference" value, which indicates the markup applied in the selected period.
- A "Cloud provider Spend" bar chart, which indicates the cost billed to the client for each provider in the selected period.
- An "Effective Spend" bar chart, which indicates the effective cost of resources on the provider.

At the bottom, there will be several resource aggregation charts, for example, by Region or Service Type, as indicated by the respective cloud providers, and as we will analyze later, it will be possible to customize the available charts and sections.

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

*Figura 305 – Cost Dashboard*

In the cost functionality, it is possible to filter by resource type using the tab bar at the top, while for a general view, the dashboard can be used.

*Figura 306 – Filter by resource type*

Cost Section Filters

Within the page, a series of filters are available that can be selected simultaneously to filter the dashboard results.

The main filter is the display period, which can be found in the upper right. Clicking on it will open a selection window (in yellow in the figure) where it will be possible to either enter a custom time range, using the "From" and "To" fields on the left, or select a "smart" time range by clicking directly on the desired choice in the scrollable section on the right.

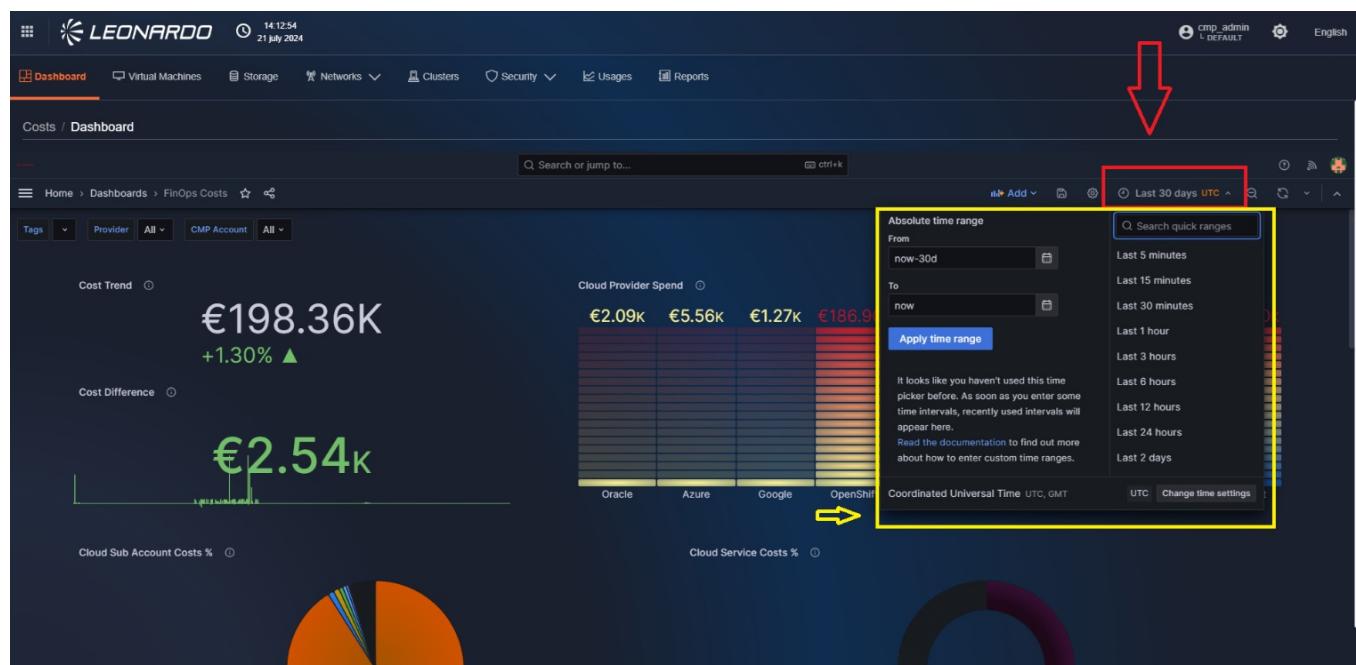

Figura 307 – Cost time filter

A series of filters are available in the upper left of the page, allowing you to filter the retrieved resources. Specifically, you can filter by:

- Tag
- Provider type
- Subsystem name.

These filters allow multiple values to be selected and can be combined to achieve the desired granularity

Figura 308 – Cost functionality filters

Overview of the data shown

"General" Section

In the first section, summary charts representing provider and SCMP costs are shown to the user based on the applied filters.

In detail:

- **Provider Cost Difference:** chart containing the cost difference between the sum of the original provider costs and the sum of the costs agreed upon with the provider.
Useful for identifying savings obtained through negotiation or resale compared to list prices.
- **Customer Cost Difference:** chart containing the cost difference between the sum of SCMP costs charged to the customer and the sum of the original provider costs.
Used to monitor profit margins and the competitiveness of prices offered to the customer.
- **Customer Cost Trend:** chart containing the total SCMP costs charged to the customer, with the respective profit/loss percentage.
Allows observing economic trends over time and detecting cost peaks or anomalies.
- **Provider Spend:** chart containing the sum of original costs for each provider.

Allows identifying which providers the spending is concentrated on and the level of dependency.

- **Provider Agreement Spend:** chart containing the sum of agreed costs for each provider.
Useful for comparing the effectiveness of commercial agreements with each provider.
- **Effective Spend:** chart containing the sum of SCMP costs charged to the customer for each provider.
Helps evaluate the profitability obtained from each provider.

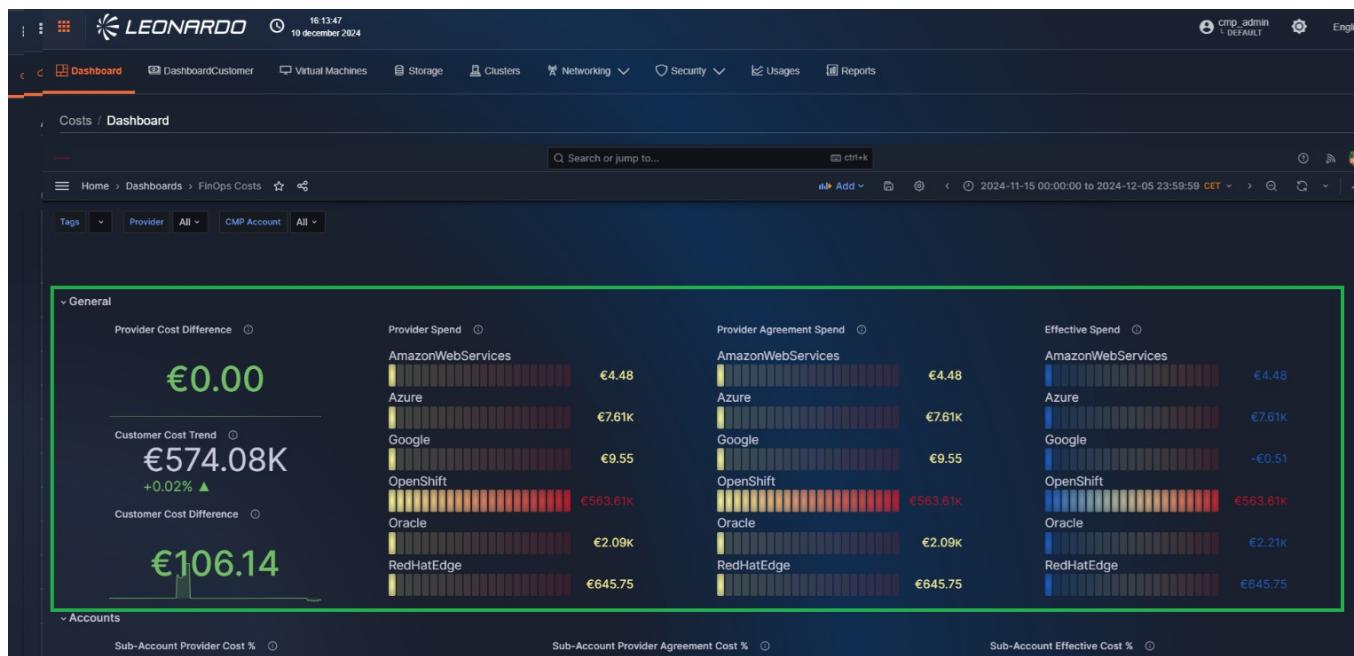

Figura 309 – General

"Accounts" Section

In the second section, charts focused on the costs generated by each subordinate account of each provider are shown to the user.

In detail:

- **Sub-Account Provider Cost %:** Percentage of the total provider cost, for each account.
Used to identify the most expensive accounts and analyze the distributed economic load.
- **Sub-Account Provider Agreement Cost %:** Percentage of the total agreed provider cost, for each subordinate account.
Useful for checking which accounts benefit from more significant discounts.

- **Sub-Account Effective Cost %:** Percentage of the total SCMP cost charged to the customer, for each subordinate account.
Allows seeing which accounts generate more revenue.

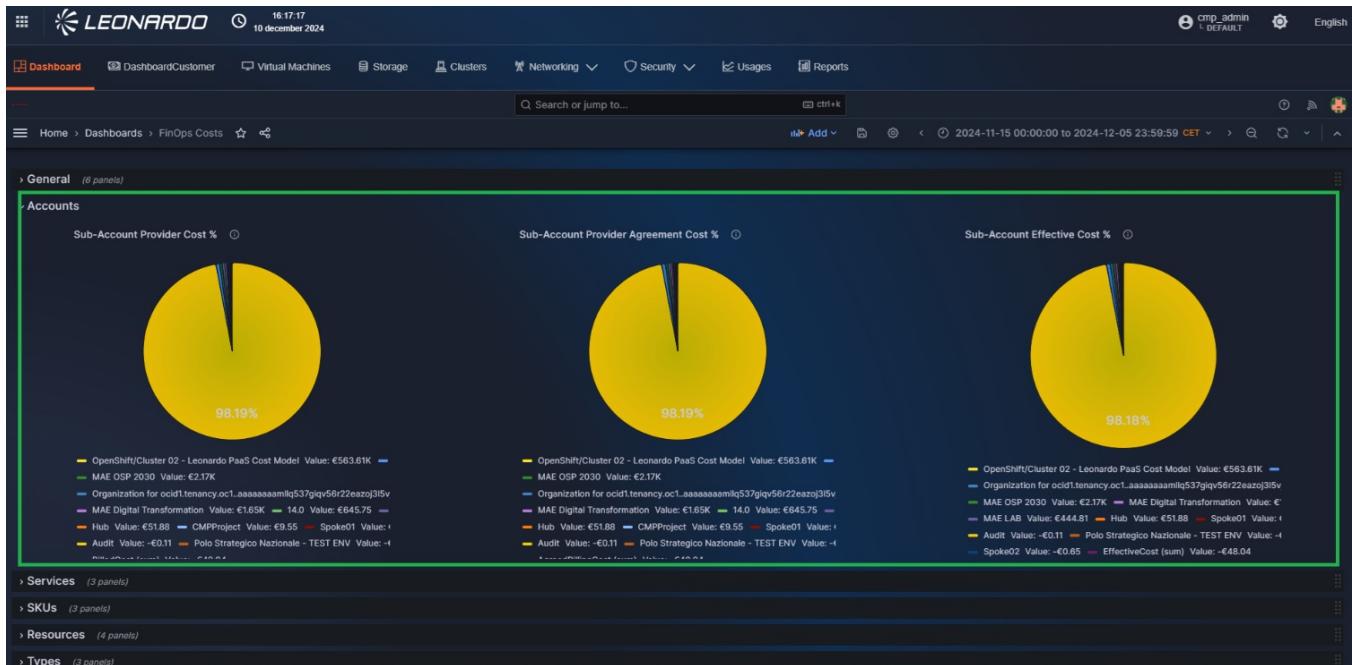

Figura 310 – Accounts

"Services" Section

In the third section, charts focused on the costs generated by each cloud service of each provider are shown to the user.

In detail:

- **Service Provider Cost %:** Percentage of the total provider cost, for each service.
Allows understanding which services (e.g., compute, storage, network) have the most impact on costs.
- **Service Provider Agreement Cost %:** Percentage of the total agreed provider cost, for each service.
Useful for analyzing the effectiveness of negotiations on various services.
- **Service Effective Cost %:** Percentage of the total SCMP cost charged to the customer, for each service.
Provides a clear view of the main revenue sources per service.

15 Dec 2025

09:00

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

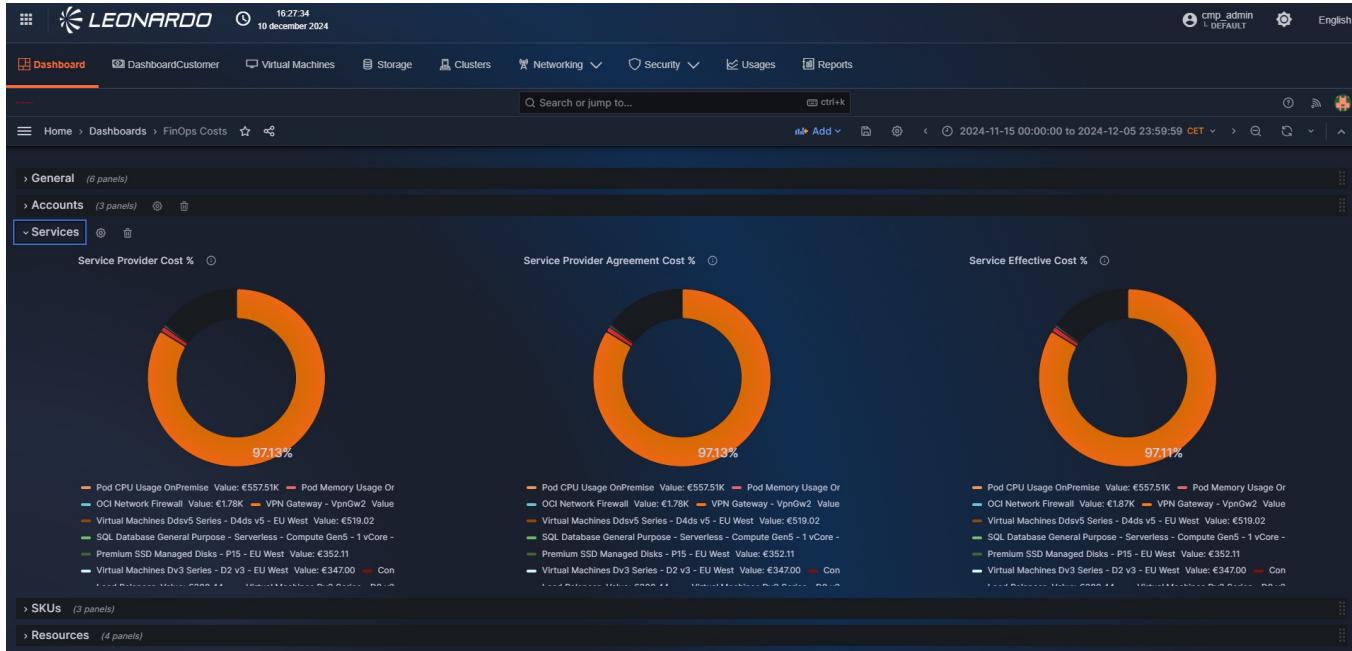

Figura 311 – Services

"SKUs" Section

In the fourth section, charts focused on the costs generated by each SKU of each provider are shown to the user.

In detail:

- **Sku Provider Cost %:** Percentage of the total provider cost, for each SKU.
Allows detailed cost analysis at the billing unit level.
- **Sku Provider Agreement Cost %:** Percentage of the total agreed provider cost, for each SKU.
Useful for evaluating whether individual SKUs also benefit from discounts and optimizations.
- **Sku Effective Cost %:** Percentage of the total SCMP cost charged to the customer, for each SKU.
Helps highlight any imbalances in margins at the SKU level.

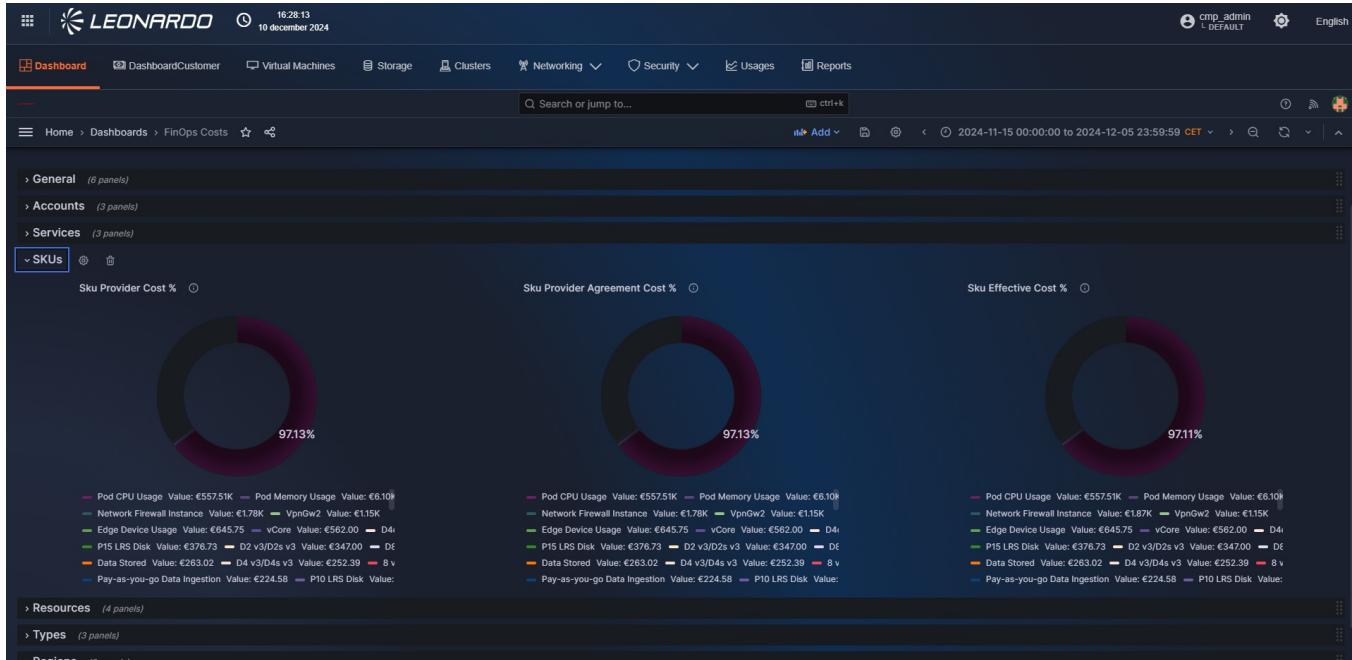

Figura 312 – Skus

"Resources" Section

In the fifth section, charts focused on the costs generated by each resource of each provider are shown to the user.

In detail:

- **Resource Provider Cost %:** Percentage of the total provider cost, for each resource.
Allows the identification of particularly expensive or underutilized resources.
- **Resource Provider Agreement Cost %:** Percentage of the total agreed provider cost, for each resource.
Allows seeing if discounts are distributed equally among resources.
- **Resource Effective Cost %:** Percentage of the total SCMP cost charged to the customer, for each resource.
Provides visibility into the profitability of individual resources.

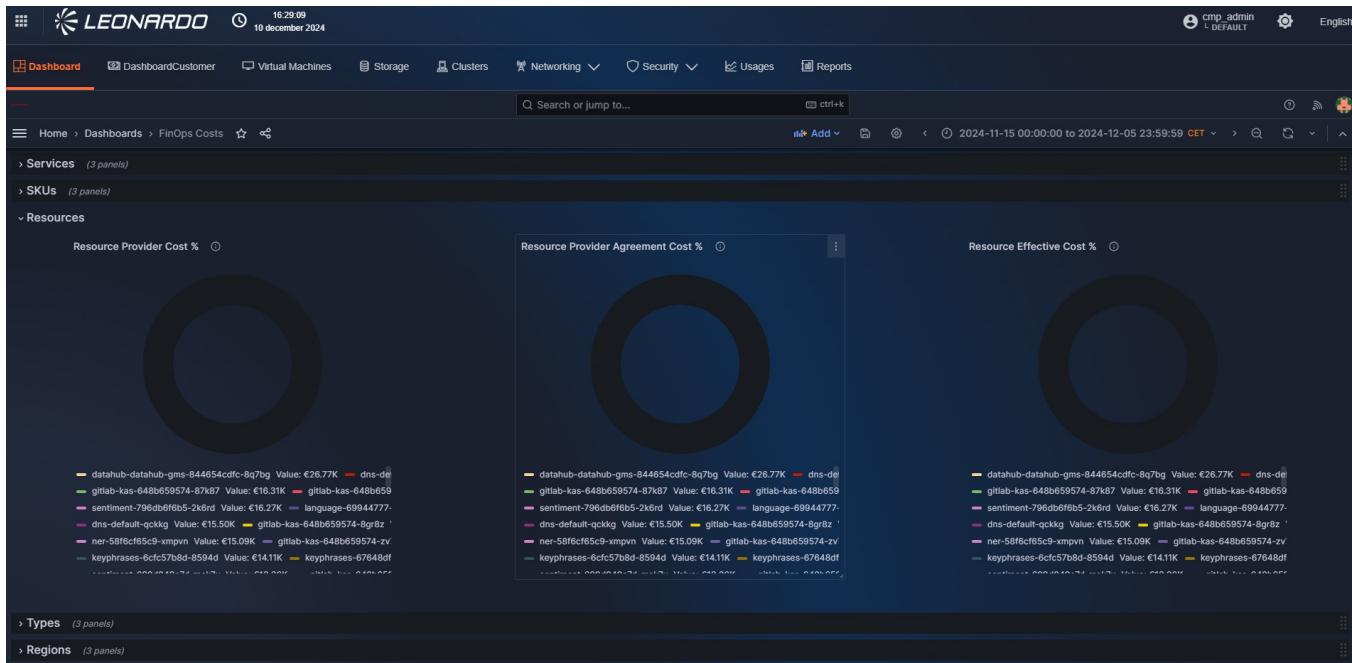

Figura 313 – Resources

"Types" Section

In the sixth section, charts focused on the costs generated by each inventory resource type of each provider are shown to the user.

In detail:

- **Resource Type Provider Cost %:** Percentage of the total provider cost, for each resource type.
Offers an aggregated view useful for cost planning.
- **Resource Type Provider Agreement Cost %:** Percentage of the total agreed provider cost, for each resource type.
Helps understand which types are most optimized through agreements.
- **Resource Type Effective Cost %:** Percentage of the total SCMP cost charged to the customer, for each resource type.
Allows measuring the commercial weight of each category.

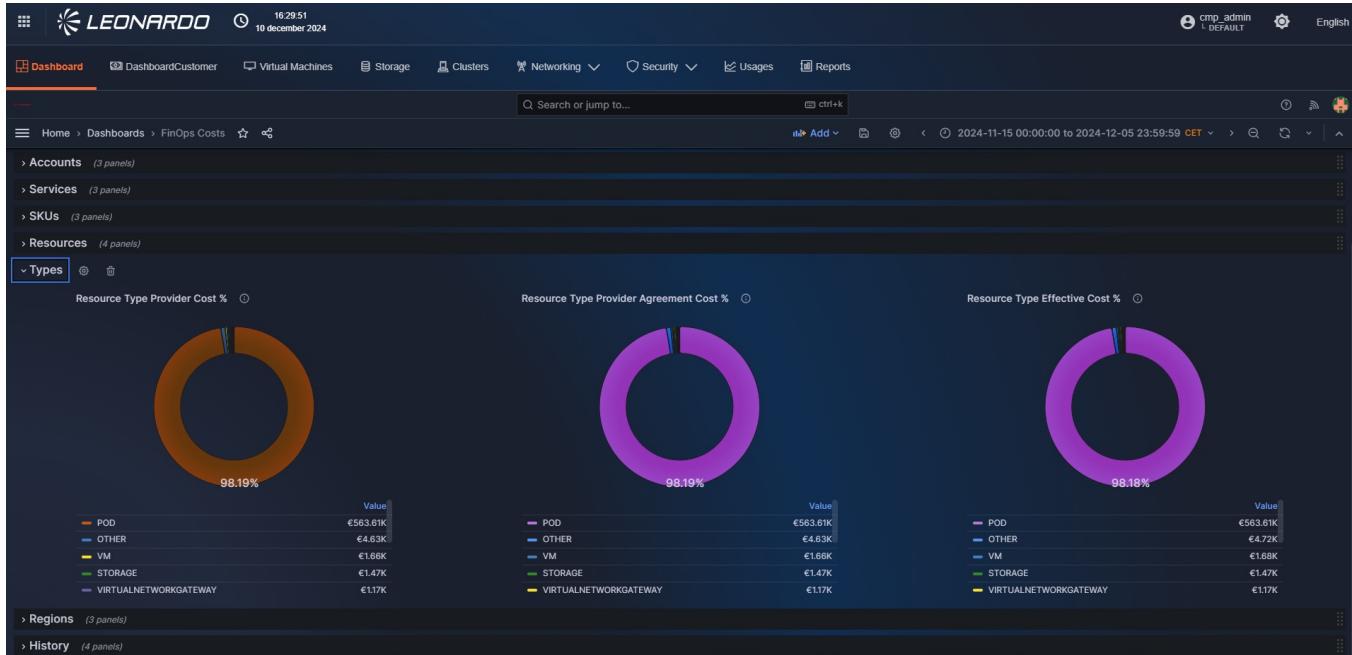

Figura 314 – Types

"Regions" Section

In the seventh section, charts focused on the costs generated in each region of each provider are shown to the user.

In detail:

- **Regional Provider Cost %:** Percentage of the total provider cost, for each region. *Indicates where resources are geographically located and their associated expenses.*
- **Regional Provider Agreement Cost %:** Percentage of the total agreed provider cost, for each region. *Allows evaluating the convenience of chosen regions based on discounts.*
- **Regional Effective Cost %:** Percentage of the total SCMP cost charged to the customer, for each region. *Useful for analyzing the distribution of revenue by geographical area.*

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

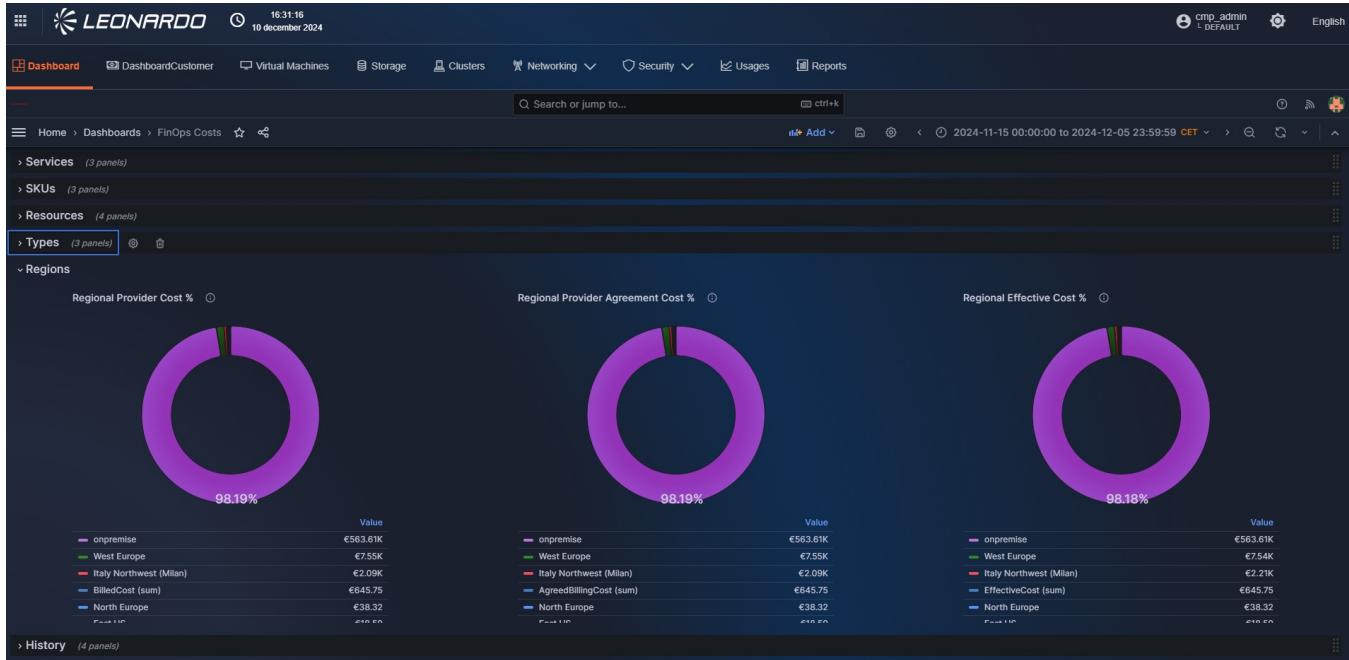

Figura 315 – Regions

"History" Section

Finally, in the eighth section, charts focused on the historical costs of each billing account, generated by each subsystem integrated into the SCMP, are shown to the user.

In detail:

- **System Costs Details:** Comparison between the total provider cost, the total agreed provider cost, and the total customer cost, for all subsystems integrated into the SCMP. *Fundamental for retrospective analysis and for evaluating the economic sustainability of the system.*
- **Historical Provider Billing Costs:** History of the trend of total costs for each cloud billing account. *Helps predict future trends and anticipate spending or budget issues.*

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

Figura 316 – History

Limited view for the customer

If a user configured with the "LIMITED" parameter is used to access the cost dashboard, the charts available on the dashboard will only relate to the recalculated SCMP costs, while the actual costs received from the providers will not be visible as they are superfluous, as can be seen in the image.

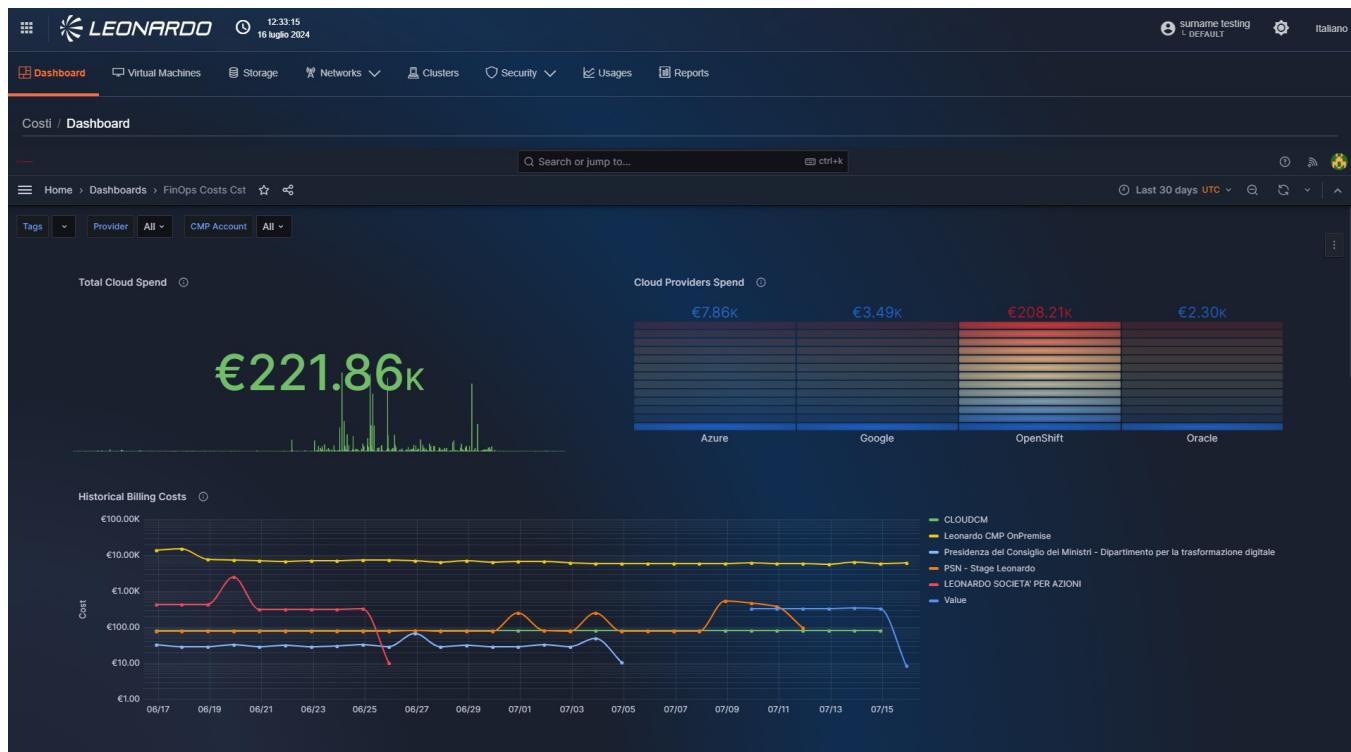

Figura 317 – Limited cost dashboard

"Usage" Dashboard

In addition to the main cost dashboard and its related detailed dashboards by resource type, in the SCMP Costs module, the user can view an additional dashboard, focused on the consumption of inventory resources integrated into the platform.

By navigating to the Usages section of the module, generic and detailed information on the consumption of individual integrated services/SKUs and their respective resources will be shown.

To access the functionality, above the breadcrumb path, click on the "Usages" tab.

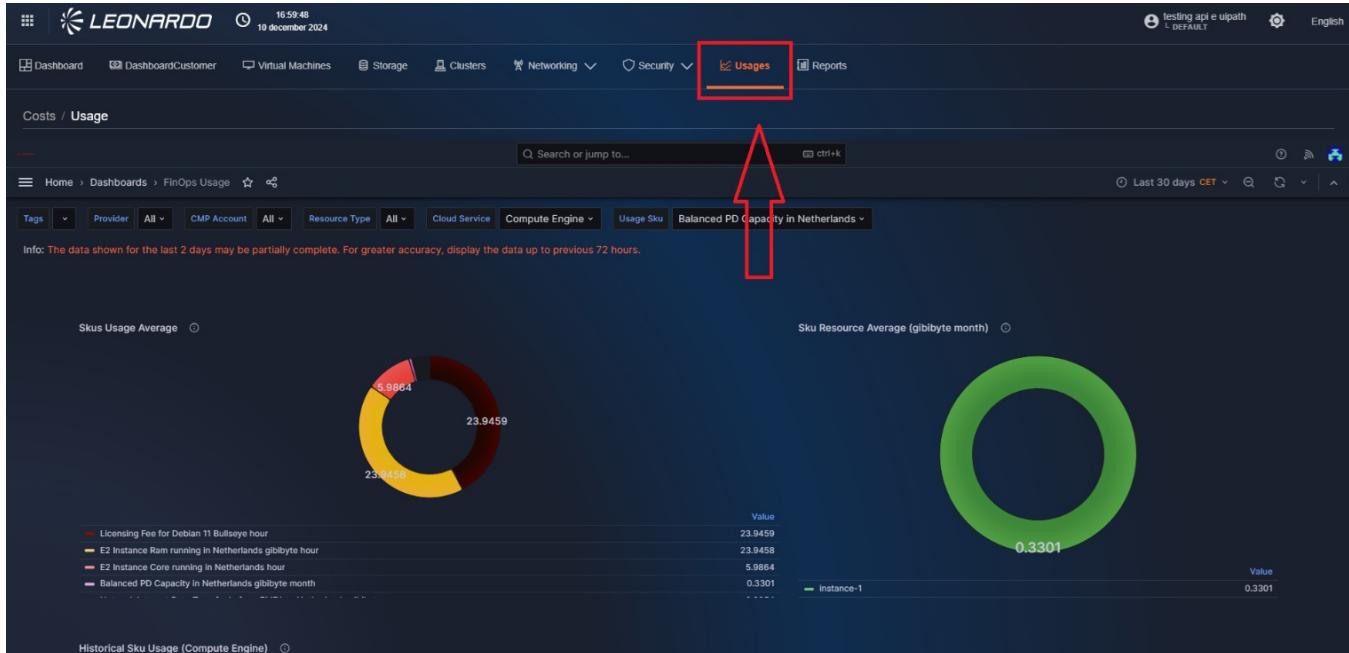

Figura 318 – Access to "Usages"

Usage section filters

Within the page, a series of filters are available that can be selected simultaneously to filter the dashboard results.

The main filter is the display period, which can be found in the upper right. Clicking on it will open a selection window (in yellow in the figure) where it will be possible to either enter a custom time range, using the "From" and "To" fields on the left, or select a "smart" time range by clicking directly on the desired choice in the scrollable section on the right.

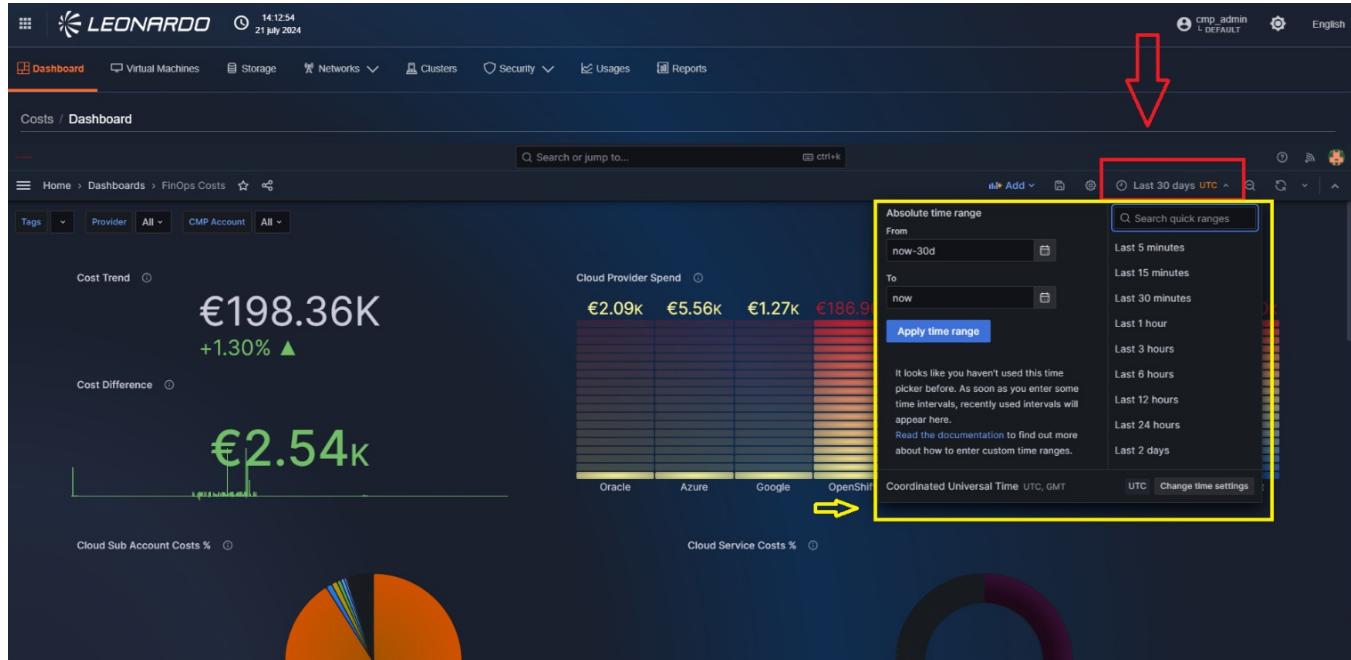

Figura 319 – Usage time filter

A series of filters are available in the upper left of the page, allowing you to filter the retrieved resources. Specifically, you can filter by:

- Tag
- Provider type
- Subsystem name.
- Resource type
- Cloud service name
- Cloud SKU name

These filters allow multiple values to be selected and can be combined to achieve the desired granularity.

Figura 320 – Cost functionality filters

Overview of the data shown in the costs section

"SKUs Usage Average" Section

The first chart represents the daily average consumed by each SKU. It is a summary chart that shows the user the general trend of consumption.

For each SKU, in fact, the average consumption and the unit of measure are indicated, within the specified time range, to briefly show which of them are, on average, most used and consequently which of them could generate higher costs for the user.

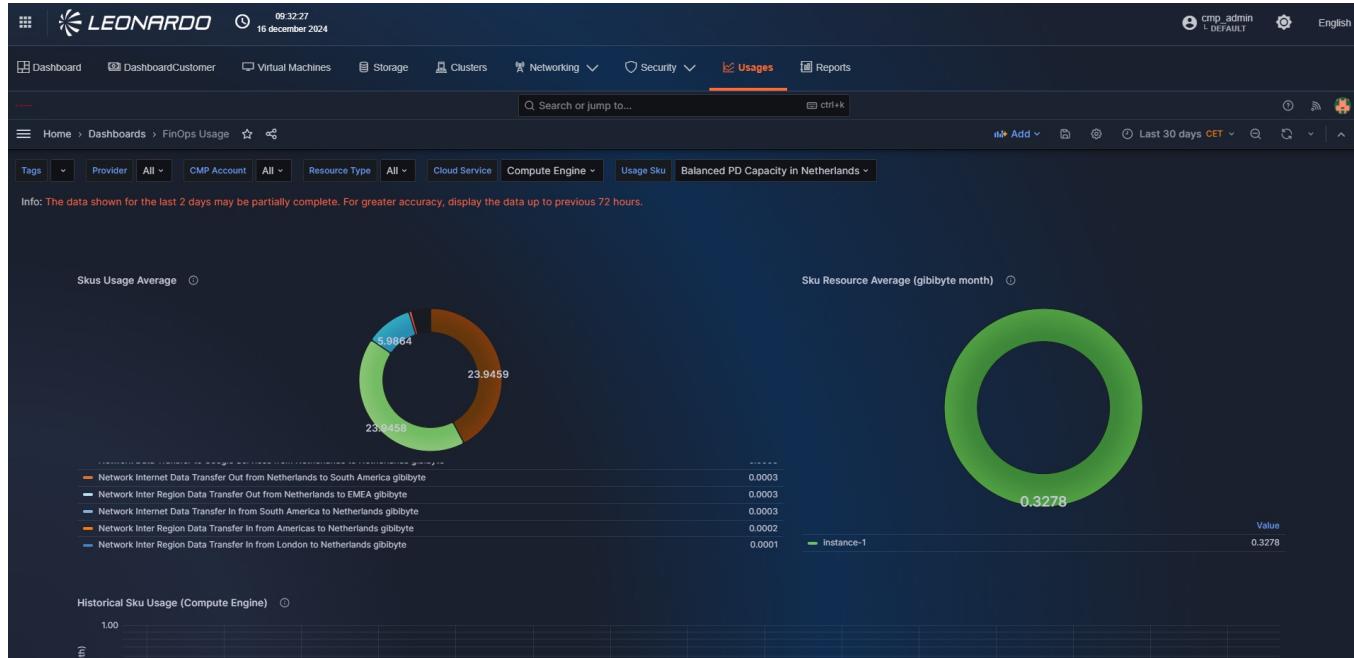

Figura 321 – "SKUs Usage" Section

"SKU Resource Average" Section

The second chart, on the other hand, is focused on the SKU selected as a filter by the user and shows the daily average consumed by each resource, correlated to the specific SKU.

It too can be classified as a summary chart that provides the user with which resources for a given SKU are, on average, most used and consequently which of them could generate higher costs for the user.

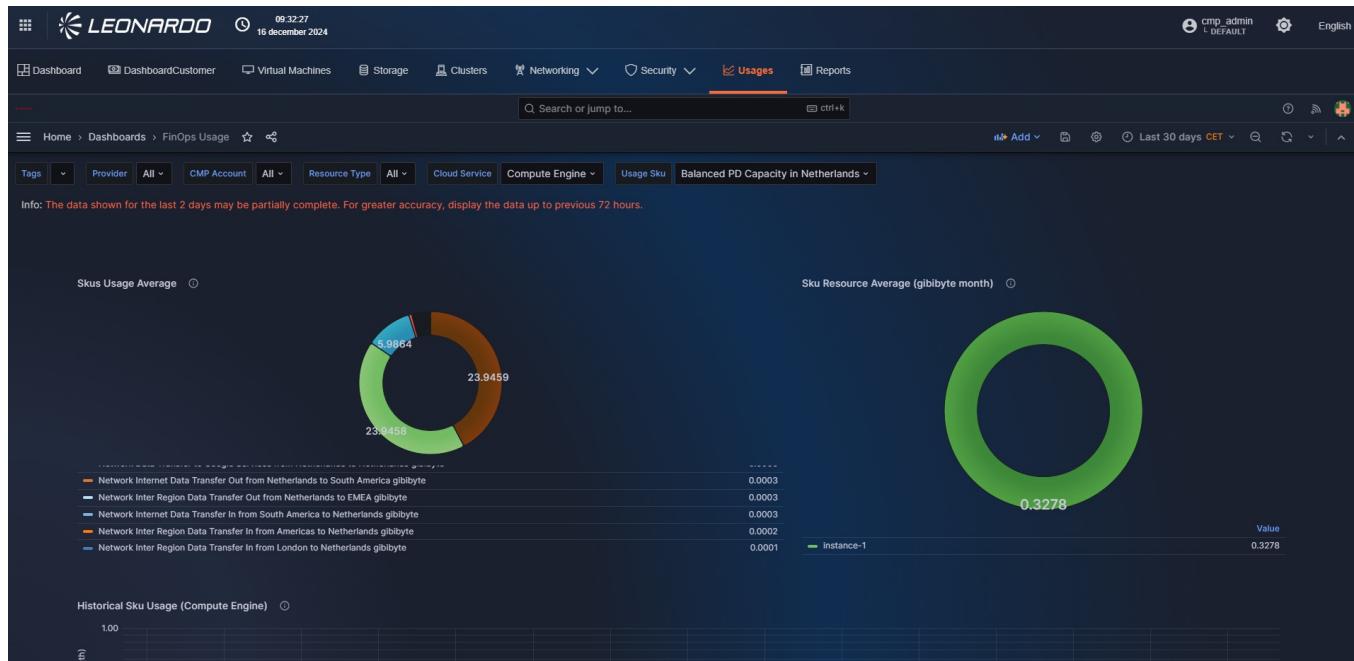

Figura 322 – "SKU resource" Section

"Historical SKU Usage" Section

The first temporal chart shows the daily consumption trend of the specific SKU, selected as a filter in the dashboard.

In the case shown, a constant consumption (in hours) over time is highlighted, useful for the user for subsequent analysis phases.

15 Dec 2025

09.00

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

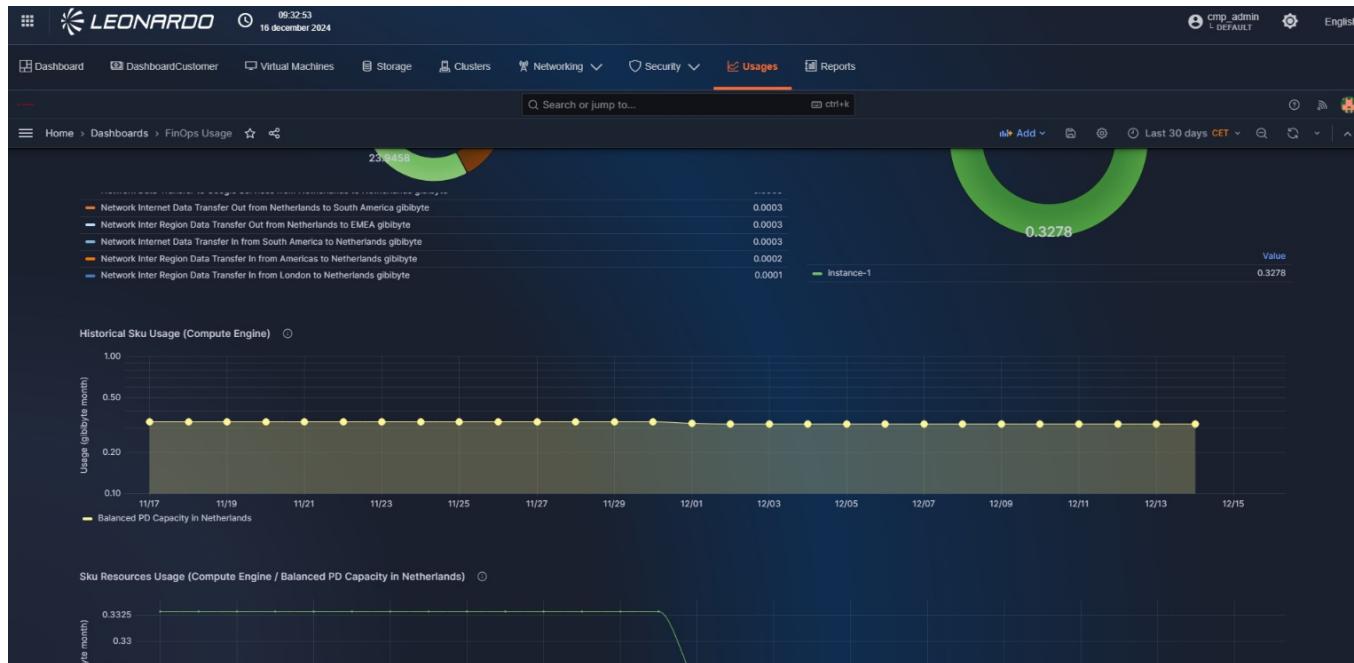

Figura 323 – "Historical SKU" Section

"SKU Resources Usage" Section

The second temporal chart, on the other hand, shows the daily consumption trend of the specific SKU, for each resource related to it.

This chart, therefore, shows the user the historical detail of the previous chart, highlighting which resources are involved in the consumption of the specific SKU and to what extent.

This last chart is particularly useful to the user because it highlights which resources are actually used within a specific SKU and, consequently, which of them could lead to higher costs for the user or be paid for without even being used.

For dashboard customization, please consult the official guide

Reporting Tools

The reporting functionality, specific per feature, allows generating global reports of the information available for the various providers. Within the pages, the possibility to create files to facilitate information sharing will also be provided.

To access the functionality, above the breadcrumb path, click on the "Reports" tab

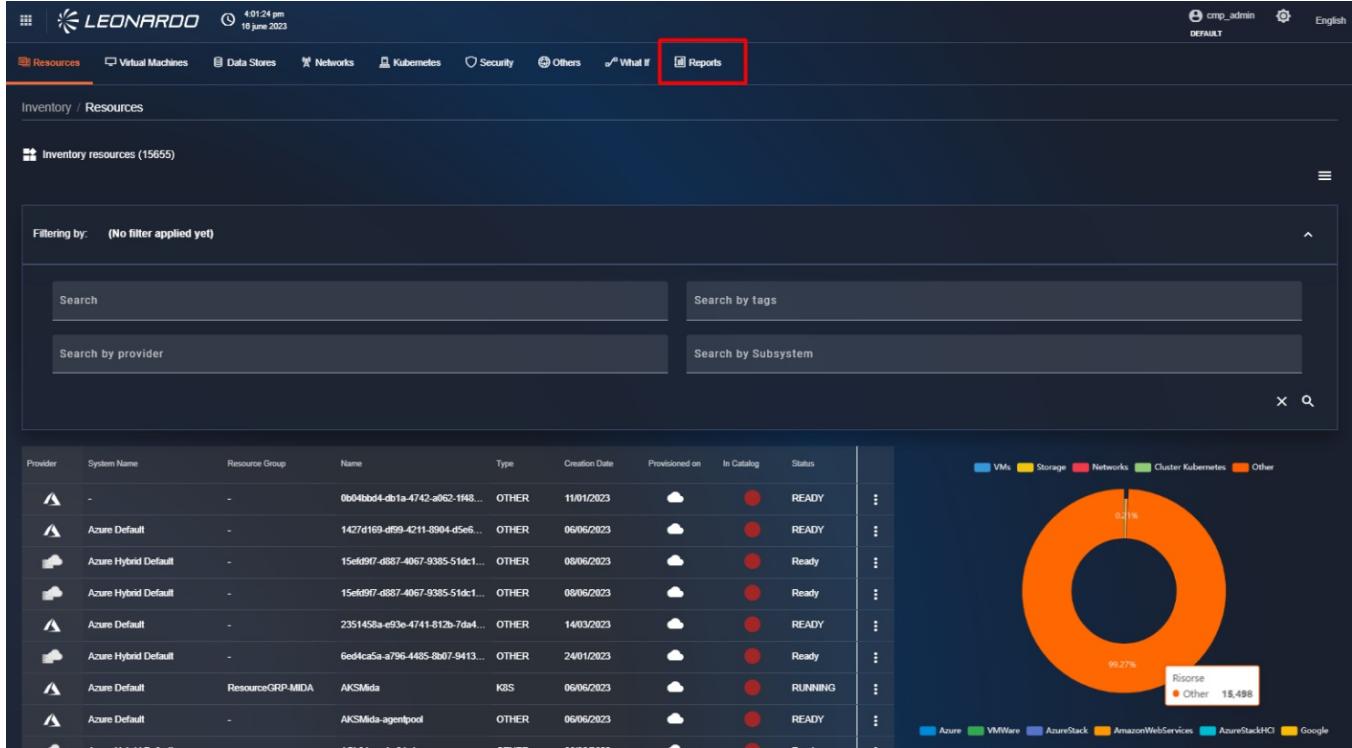

Figura 325 – Access to Catalog report

Available report types

- **Cost Summary** – Summary of total cost per service, based on the selected filter combination.
- **Cost Summary – Group by Resource Type** – Summary of total cost per service, with an indication of the number of resources involved, based on the selected filter combination.
- **Cost Details** – Detail of daily regional cost per resource, based on the selected filter combination.
- **Cost Details – Group by Resource Type** – Detail of total daily cost per service, with an indication of the number of resources involved, based on the selected filter combination.
- **FinOps Report** – Summary of total costs and total resource usage according to the FinOps FOCUS standard, for financial optimization of cloud services, based on the selected filter combination.

Creating a report

In the upper right of the page, we can click on the "New Report" button to start creating a report. Specifically, a modal window appears containing the list of available report types.

Figura 326 – New report creation

Once the report type is selected, click on the “Configure” button to select the providers to include in the report. In the newly opened window, you will find the “Provider” field, which allows you to select one or more pre-existing providers in the system. Subsequently, it is possible to select one or more subsystems to include in the report; if no providers are selected, no subsystem can be selected. Finally, there is a “tag” section to include only resources that have the entered tag.

Report Scheduling

If, instead, you want to schedule automatic report execution, you will need to select “Recurring” for the “Report Type” field. In this case, the window updates to show additional parameters for configuring the periodic report.

The parameters to enter are:

- Period: allows selecting the report sending frequency (hourly, daily, ...).
- “Receive only if not empty” if selected, the file will not be sent when no information is present inside
- Report Language: allows selecting the language used in the report.
- File format: allows selecting one or more file types to include in the email.
- User E-mails: allows entering an email address to send reports to. After entering an email, it is necessary to press “Enter” on the keyboard to confirm its insertion. Once pressed, the newly entered email will move to the bottom box, and the field will be cleared to allow the insertion, if necessary, of a new email.

List of Scheduled Reports

To view the list of scheduled reports, select the “Scheduled” tab located at the top left of the reports page.

The screenshot shows the Leonardo interface with the 'Reports' tab selected. The 'Scheduled' tab is highlighted with a red box and an arrow pointing to it from the text above. The table below lists one scheduled report entry:

Period	Language	Recipients	Last sent	Actions
Hourly	EN	noame@gmail.com	12/06/2024 - 1:21 PM	⋮

Figura 331 – List of scheduled reports

On this page, you will find the list and related information of the scheduled reports present in the system. For each result, by clicking the “Three dots” button on the right, three operations can be performed:

- View the last generated report.
- Edit the schedule settings; it will not be possible to modify the selected providers or subsystems.
- Delete the schedule to stop sending emails.

Figura 332 – Editing a schedule

Report Usage

By clicking on the row of a static report, or using the “Show report” button available for scheduled reports, you will be able to view the detail page of the selected report.

Within the Inventory report summary, there is a "Stats" section which includes the number of disks, interfaces, networks, and virtual machines belonging to the selected provider.

Below the “Stats” section, there are the filters used by the user to generate the report.

Below the filters, there is a summary table of resources belonging to the providers. On the right, there are two buttons: “PRINT” and “EXPORT”.

Clicking the “PRINT” button brings up a print preview modal. To print the report, click the “Stampa” (Print) button in the lower right; at this point, the printing of the aforementioned will start.

Clicking the “EXPORT” button allows exporting the report in “.csv”, “.json” or “.pdf” format.

To return to the “Results” tab, click the “CLOSE” button in the lower right, or click the left-pointing arrow in the upper left, next to the report title.

Figura 333 – Report details

11 Provisioning

Provisioning is one of the most important functionalities of SCMP. Through these modules, it is possible to allocate runtime assets within the providers managed by SCMP.

To use this functionality, relations must be defined within the SCMP.

This constraint was made available to bind certain characteristics to provisioning; for example, the VM size is not selectable during provisioning but is among the predefined characteristics by administrators within the catalog.

Provisioning

Log and Audit

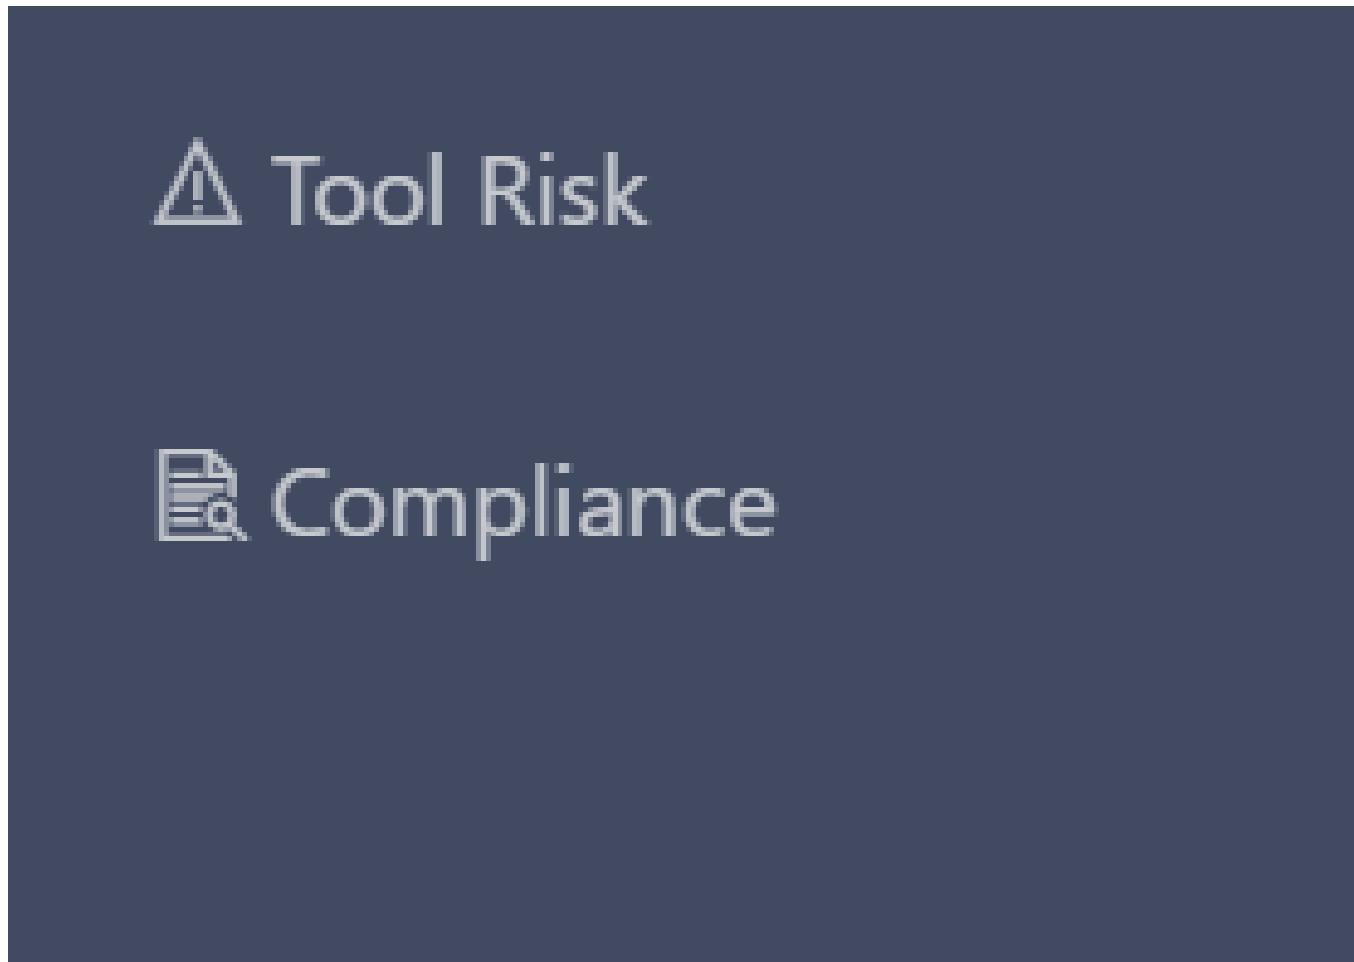

Figura 334 – Access to "Provisioning"

11.0.1 Dashboard

Accessing the functionality, the first available page is the Dashboard of provisionings carried out within the system.

The page presents a series of graphs, filters, and the list of provisionings performed.

The graphs allow visualizing the information present in the table, grouped by:

- The total of all provisionings carried out, divided by type.
- The status of provisionings carried out, divided by outcome and category of the provisioned asset.

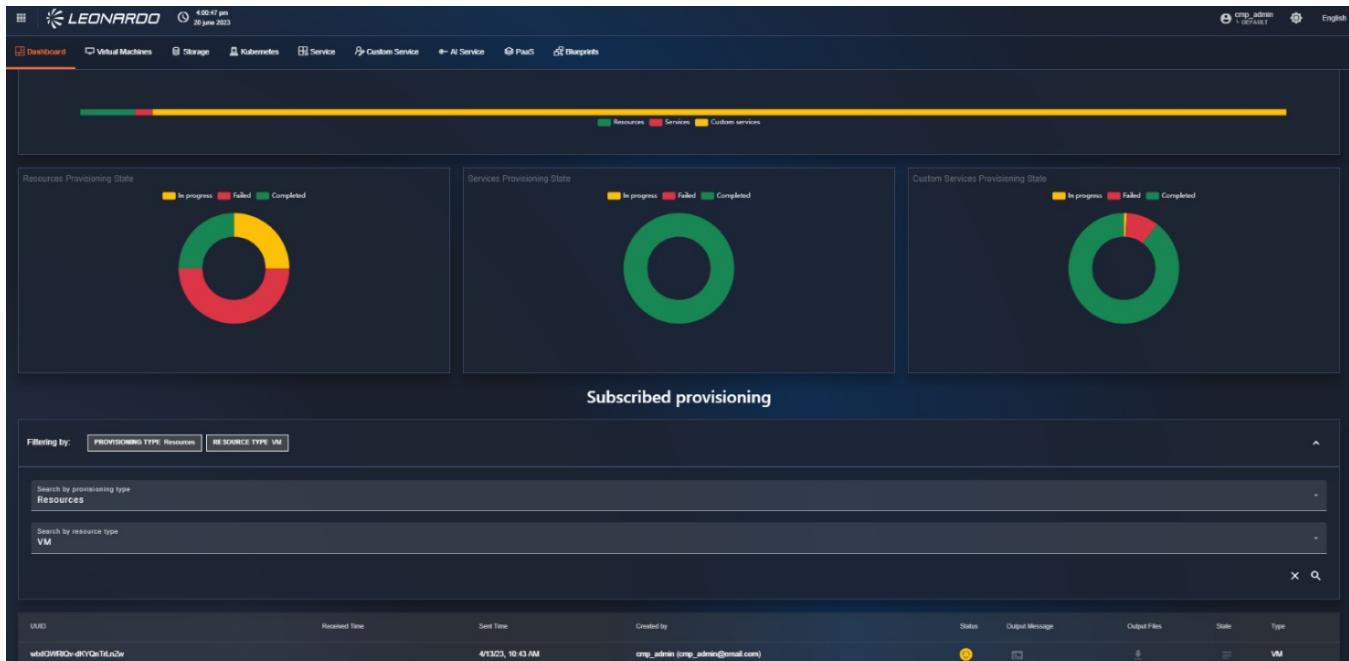

Figura 335 – Provisioning page graphs

At the bottom of the page, we can use the filters section to modify the results present in the table. The "Provisioning Type" filter is the main filter that allows selecting the type of asset to display, specifically:

- Selecting "Resources" adds a filter that allows selecting the type of resource for which you want to display the provisioning status. By default, the system shows the list of provisioned VMs.
- Selecting "Services" and "Custom services" has no additional filters, and the list is updated with only provisionings related to Services.
- Selecting "Blueprint" adds a filter that allows changing the flow (i.e., the type of blueprint to display), and the table is modified to show only flows not yet completed. Above the table, there is a control that allows changing tabs, to switch from "in progress" flows to "Completed" flows.

11.0.2.3 Blueprint

The list has the following attributes when "Blueprint" is selected as a filter:

- Blueprint Name
- Creation Date
- User who provisioned the blueprint

Above the table, we can notice two tabs. By clicking on them, the table is filtered respectively for Blueprints to be completed and Completed Blueprints (in red in the image).

Subscribed provisioning

Filtering by: PROVISIONING TYPE Blueprints

Search by provisioning type: Blueprints

To be completed → Completed/Failed

Name	Creation date	Created by
Docker development environment	18/03/2024 09:46:30	cmp_admin
Docker development environment	14/03/2024 09:29:13	cmp_admin
Only manual	14/03/2024 09:12:56	cmp_admin

Figura 342 – “Provisioning blueprint” table tabs

In this view, it is possible to click on a table row to view the blueprint details.

When the selected blueprint is "to be completed," we will be redirected to the blueprint provisioning page where we can perform the necessary operations for completion.

11.0.3 Creation of Provisionings

11.0.3.1 Provisioning of "Physical Resources"

Using the tabs in the provisioning functionality, it is possible to view the lists of provisionable resources within the SCMP, such as Virtual Machines, Storage, and Kubernetes.

To view elements within the result lists, it is necessary that a relation exists in the SCMP catalog with the catalog resource of the provider to be provisioned.

The functionalities available for these elements are identical; only the parameters to be entered in the creation steps change.

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there is a navigation bar with icons for Dashboard, Virtual Machines (which is highlighted with a red box), Storage, Kubernetes, Service, Custom Service, AI Service, PaaS, and Blueprints. Below the navigation bar, the title 'Provisioning / Virtual Machines' is displayed. The main area contains a table with three rows of data. The columns are labeled: UUID, Type, Provider, Size, and Creation Date. The data rows are:

UUID	Type	Provider	Size	Creation Date
catalog_1992feb-63e3-4109-a4a4-f47cf5f78bd8	VM	CMP	t3-micro,d2s_v3,c2-micro	06/06/2023
catalog_0cb71ba0-d74a-4ceb-a326-587eb3fe34e2	VM	CMP	Standard_D4s_v3,D1_v2	06/06/2023
catalog_b7afe0ca-dfe4-41b5-98fd-9fe090a4727a	VM	CMP	Standard_B4ms,Ds1_v2,F8s_v2	06/06/2023

At the bottom right of the table, there are pagination controls: 'Items per page 10' and '1 - 3 of 3'.

Figura 345 – Tabs for resource creation

11.0.3.1.1 Virtual Machines

To start provisioning a resource, click on the corresponding row to view the page containing step 1 of provisioning creation. In this step, it is necessary to select, using the dropdown on the left, the "target" subsystem where the resources are to be provisioned. Once selected, an information mirror will be displayed on the right indicating the characteristics of the resource that will be provisioned. To continue, click the "Next" button at the bottom right to go to step 2 "Config" page.

15 Dec 2025

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

The screenshot shows the 'Virtual Machines' section of the Leonardo platform. In the top navigation bar, 'Virtual Machines' is highlighted. The main area is titled 'Add' and shows a step-by-step process. Step 1 is 'Subsystem' (selected), showing a dropdown menu with 'CONSHIP Management'. Step 2 is 'Config', displaying system details: 'Standard_B8ms (Azure)', 'Total CPU: 8', 'Total RAM: 32 GB', and 'Size: B8ms'. Step 3 is 'Plan'. A 'Next' button is visible at the bottom right.

Figura 346 – Selection of the “target” subsystem, provisioning step 1

On the "Config" page of step 2, fill in all mandatory fields in all sections of the form. At the bottom left, click the "Reset" button to reset all fields on the page.

Instead, on the right, click the "Submit" button to go to step 3 "Plan".

The screenshot shows the 'Virtual Machines' section of the Leonardo platform. The main title is 'Provisioning / Virtual Machines / Add'. On the left, there's a sidebar with icons for Dashboard, Virtual Machines, Storage, Kubernetes, Services, Blueprints, and Workflow. The main area is titled 'new virtual machine' and 'Configuration Options'.

🔍	Virtual Machine Name * <hr/>
🔍	Resource Group * <hr/>
🔍	Storage Type (Disk for OS) * <hr/>
🔍	Storage Size (Disk for OS) GB 10 <hr/>
🔍	Image * <hr/>
🔍	Network <hr/> Network <hr/>

🔍	<input type="checkbox"/> Add storage
🔍	User name for access <hr/>
🔍	User name for access * <input type="text"/> Password * <input type="password"/> <hr/>
🔍	Tags <input type="text"/> <hr/>
🔍	<input type="button" value="Reset"/> <input type="button" value="Submit"/>

Figura 347 – Filling in the resource prediction form fields

After clicking the "Submit" button, the user is redirected to the "Plan" page of step 3 where we can view the provisioning plan sent by Terraform, which indicates all the parameters of the resources that will be configured, and at the bottom, there is a list with a cost perspective.

The screenshot shows the "Plan" page of the Secure Cloud Management Platform. At the top, it displays the Leonardo logo and the date/time (5:57:25 pm, 29 october 2022). On the right, there are user and language settings. The main content area shows the Terraform execution plan and costs.

Terraform Plan:

```

Terraform used the selected providers to generate the following execution
plan. Resource actions are indicated with the following symbols:
+ create

Terraform will perform the following actions:

# azurerm_linux_virtual_machine.vmtest will be created
+ resource "azurerm_linux_virtual_machine" "vmtest" {
    + admin_password          = (sensitive value)
    + admin_username          = "admin"
    + allow_extension_operations = true
    + computer_name           = (known after apply)
    + disable_password_authentication = false
    + extensions_time_budget   = "PT1H30M"
    + id                      = (known after apply)
    + location                = "northeurope"
    + max_bid_price            = -1
    ...
}
  
```

Costs:

Type	Amount	Unit	OS	Zone	Reservation Term	Description	Meter ID	Tier Minimum Units
CONSUMPTION	€0.15	1 Hour	LINUX	-	-	-	-	-
RESERVATION	€0.06	3 Years	LINUX	-	3 Years	-	-	-
RESERVATION	€0.09	1 Year	LINUX	-	1 Year	-	-	-

At the bottom right, there are three buttons: "Back", "Reset", and "Apply".

Figura 348 – Forecast screen

Still from the "Plan" page of step 3, at the bottom right, there are three buttons: "Back", "Reset", and "Apply". If you click the "Back" button, the user returns to the "Config" page of step 2 where parameters can be modified.

If you click the "Reset" button, the user is redirected to the "Subscription" page of step 1 where it is necessary to select a subsystem, and then enter the parameters on the "Config" page of step 2.

Finally, if you click the "Apply" button, the forecast is saved, and the user is redirected to the "Dashboard" tab page where the user verifies the presence of the newly created forecast.

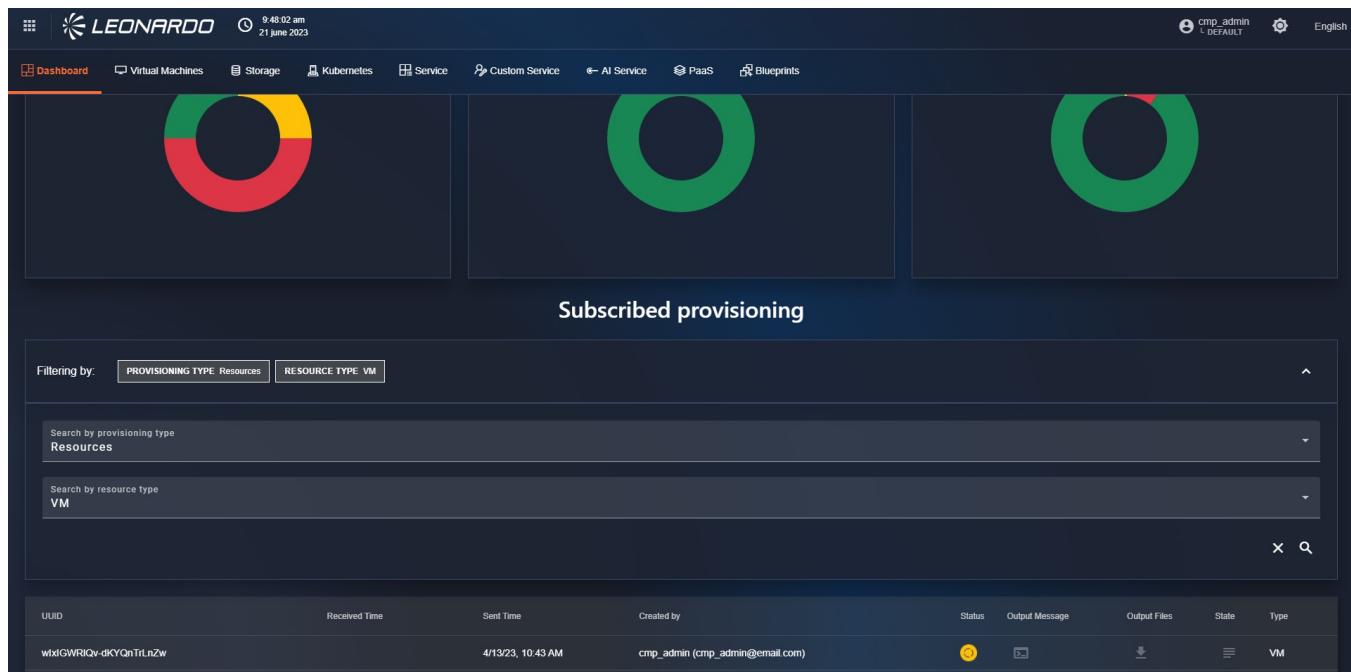

Figura 349 – List of provisions performed

11.0.3.2 Provisioning of "Services"

To access the services page, click on the tab that depicts a shelf located in the top menu. After doing this, you will find yourself on the "Service" page.

The screenshot shows the Leonardo SCMP interface. At the top, there's a navigation bar with tabs for Dashboard, Virtual Machines, Storage, Kubernetes, Services (which is highlighted with an orange box), Blueprints, and Workflow. Below the navigation bar, the page title is 'Provisioning / Services'. On the left, there's a sidebar with a 'Filter by text' input field and a 'Categories' section containing a tree view of service types: AI & Machine Learning, Analytics, Application Runtime, Big Data, Blockchain, Cloud Provider, Compute, Containers, Database, and DevOps. The main area displays a grid of service cards. One card, 'Text Analytics / NLP', has a yellow arrow pointing to its 'Subscribe' button. Other visible cards include 'PaaS - Nginx', 'Audio Analytics', 'Azure Resource Group', 'Redis DB', 'Subscription Alias Full Parameters PSN', 'Echo String', and 'Kafka'. Each card contains a brief description and a 'Subscribe' button.

Figura 350 – List of cards

On the page, a list of components called "Card" is displayed. Each card refers to a specific type of service; in particular, the following information is displayed:

- Service name;
- Service icon;
- Type of script used for service provisioning;
- Service description;
- "Subscribe" button to proceed with service creation.

Depending on the type of service selected, the steps for provisioning change; these will be analyzed in detail below.

11.0.3.2.1 "Standard" Services

Click the "Subscribe" button corresponding to a "standard" service. The user will be redirected to step 1 of the service creation page, and all instantiable versions of the service by SCMP will be displayed. In particular, various blocks will be shown, each with a list of configurations:

- Name and version of the service that will be instantiated.
- Name and version of the operating system that will be installed on the machine.
- Belonging provider on which the service will be provisioned.

The screenshot shows the 'Service' tab selected in the navigation bar. Under 'Provisioning / Service / Subscribe service', it displays a configuration step for Kafka. The 'Configuration' tab is active, showing two available options:

- Redis DB 7.0** (redis, redshift) OS: ubuntu-20_04-lts | Version: 3.2.1 | Available on: Azure Redis version 7.0 on Ubuntu 20.04 LTS
- Redis DB 7.0** (redis, redshift) OS: ubuntu-22_04-lts | Version: 3.2.1 | Available on: Azure Redis version 7.0 on Ubuntu 22.04 LTS

The 'Option selected' dropdown is set to '(None)'. There are 'Details' and 'Summary' tabs at the top right, and a 'Continue' button at the bottom right.

Figura 351 – Provisioning of a "standard" service

Select a software version and press the "Continue" button; the user is redirected to step 2 of service provisioning.

In step 2, it will be necessary to select a subsystem and fill out the form with the details of the chosen subsystem.

The screenshot shows the configuration options for a standard service. The 'Service' tab is selected in the navigation bar. The configuration options include:

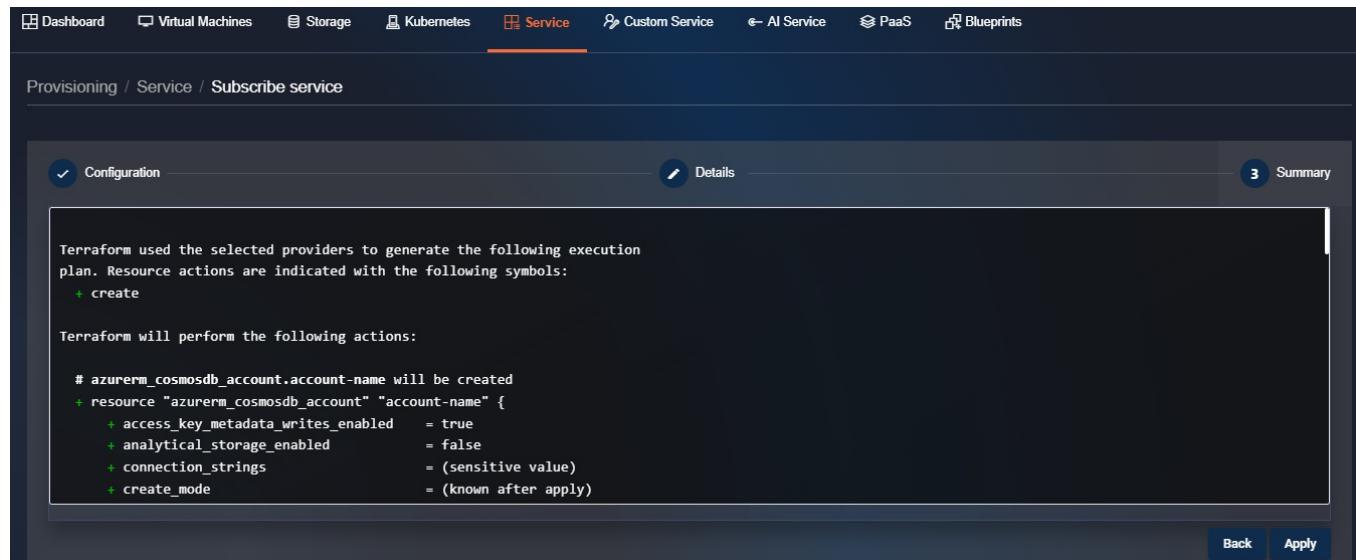

- Configuration Options**
- Account Name ***: A text input field.
- Resource Group ***: A dropdown menu.
- Location ***: A dropdown menu.
- Failover Location ***: A dropdown menu.
- Database Name ***: A text input field.
- Throughput (RU/s)**: A text input field with a value of 400.
- Tags**: A text input field.

At the bottom left is a 'Reset' button, and at the bottom right is a 'Submit' button.

Figura 352 – Configuration of a "standard" service

After completing all the form fields, click "Submit".

A request will be sent to the Terraform service, which will validate the activation configuration of the indicated flow and return the result.

The screenshot shows the 'Service' tab selected in the navigation bar. The main content area displays the Terraform execution plan. It starts with a note that Terraform used selected providers to generate an execution plan, with resource actions indicated by symbols: '+' for create. Below this, it lists the actions Terraform will perform:

```

Terraform used the selected providers to generate the following execution
plan. Resource actions are indicated with the following symbols:
+ create

Terraform will perform the following actions:

# azurerm_cosmosdb_account.account-name will be created
+ resource "azurerm_cosmosdb_account" "account-name" {
    + access_key_metadata_writes_enabled      = true
    + analytical_storage_enabled              = false
    + connection_strings                     = (sensitive value)
    + create_mode                           = (known after apply)
}

```

At the bottom right of the summary window are 'Back' and 'Apply' buttons.

Figura 353 – Service configuration summary

Click "Apply" to validate the flow and activate the service subscription.

The dashboard page will open with the list of all subscribed services and their relative statuses. Specifically, the newly provisioned service will have a "Running" status in yellow, and subsequently, depending on the result, the status will also be updated to "Completed" in green or "Error" in red.

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there's a header with the Leonardo logo, the date (23 June 2023), time (4:23:56 pm), user (cmp_admin), and language (English). Below the header, a navigation bar includes links for Dashboard, Virtual Machines, Storage, Kubernetes, Service, Custom Service, AI Service, PaaS, and Blueprints. The 'Dashboard' link is highlighted with an orange bar.

In the main content area, there's a filtering section with a dropdown set to 'PROVISIONING TYPE Services'. A search bar below it contains the text 'Services'. The main table lists four services:

UUID	Received Time	Sent Time	Created by	Status	Output Message	Output Files	State	Type

Specifically, the newly provisioned service will have a "Running" status in yellow, and subsequently, depending on the result, the status will also be updated to "Completed" in green or "Error" in red.

The screenshot shows the Leonardo Secure Cloud Management Platform dashboard. At the top, there is a header with the Leonardo logo, the date and time (4:23:56 pm, 23 June 2023), user information (cmp_admin, L DEFAULT), and language settings (English). Below the header, there is a navigation bar with links for Dashboard, Virtual Machines, Storage, Kubernetes, Service, Custom Service, AI Service, PaaS, and Blueprints. The main area is titled "PROVISIONING TYPE Services". It features a search bar with the placeholder "Search by provisioning type Services" and a "x" button. A table below lists three services with columns: UUID, Received Time, Sent Time, Created by, Status, Output Message, Output Files, State, and Type. The first service has a red "X" icon in the Status column, while the others have green checkmarks. The table rows are as follows:

UUID	Received Time	Sent Time	Created by	Status	Output Message	Output Files	State	Type
DSQblikPQuq0UVjDJRNQJQ	6/23/23, 12:23 PM	6/23/23, 12:22 PM	cmp_admin (cmp_admin@email.com)	X	X	X	X	SERVICE
VJwlnv74QF23OS0pn9FJyA	4/13/23, 10:32 AM	4/13/23, 10:25 AM	cmp_admin (cmp_admin@email.com)	✓	✓	✓	✓	VM
YB6bDobKQxukQCP40Vu1g	1/30/23, 12:29 PM	1/30/23, 12:27 PM	cmp_admin (cmp_admin@email.com)	✓	✓	✓	✓	VM

Figura 366 – Dashboard with the list of all subscribed services and their relative statuses

11.0.3.2.6 "Immutable" HELM Services

If the "immutable" flag was selected for the HELM service during creation, the user is not given the option to view and modify the service information, thus allowing for a "one-Click" installation. Once "subscribe" is selected, the system automatically begins provisioning and returns the user to the dashboard page to monitor the results.

The screenshot shows a dark-themed dashboard with the Leonardo logo at the top. The top navigation bar includes links for Dashboard, Virtual Machines, Storage, Kubernetes, Service, Custom Service, AI Service, PaaS, and Blueprints. On the left, there's a sidebar with a 'Filtering by' dropdown set to 'PROVISIONING TYPE Services'. Below it is a search bar with 'Services' selected. The main area is a table listing four services:

UUID	Received Time	Sent Time	Created by	Status	Output Message	Output Files	State	Type
DSQblikPQuq0UVjDJRNQJQ	6/23/23, 12:23 PM	6/23/23, 12:22 PM	cmp_admin (cmp_admin@email.com)	X	☒	⬇️	☰	SERVICE

Figura 367 – Dashboard with the list of all subscribed services and their relative statuses

11.0.3.3 Provisioning of "Edge" device images

To access the "Edge" provisioning page, click on the tab of the same name in the top menu.

After doing this, we will be taken to the "Edge" page of the provisioning module.

Leonardo Cyber & Security Solutions

15 Dec 2025

09.00

Secure Cloud Management Platform

The screenshot shows the Leonardo Secure Cloud Management Platform's Edge provisioning interface. The top navigation bar includes tabs for Dashboard, Virtual Machines, Storage, Edge (which is highlighted with a red box), Networking, Security, Kubernetes, Services, Blueprints, and Workflow. Below the navigation is a breadcrumb trail: Provisioning / Edge. A red arrow points upwards from the 'Filtering by' section towards the Edge tab. The main area has a dark background with a search bar and a message: 'Select a subsystem to show the images available to be applied on.' A 'Subsystem' dropdown menu is visible.

Figura 368 – Access to Edge provisioning

At first glance, the page may appear empty, but by selecting a configured EDGE subsystem from the "Subsystem" filter, all available images in the subsystem will be displayed below.

The screenshot shows the Leonardo Secure Cloud Management Platform's Edge provisioning interface with the 'Edge' tab selected. A red box highlights the 'SUBSYSTEM EdgeRHEL' filter in the 'Filtering by' section. The main area displays a list of available images under the heading 'Available Images'. The list includes:

- EdgeMonitoring_v1
- Test_v1
- pensaEdgeTest01_v1
- thinkedge_v1
- rhel/9/x86_64/edge-EdgeMonitoring_v2
- rhel/9/x86_64/edge-pensaEdgeTest01_v10
- rhel/9/x86_64/edge-pensaEdgeTest01_v11

Figura 369 – Images available in the system

By selecting one of the available images, a section will open on the right that allows selecting a compatible inventory machine from the list.

After selecting a machine, we can confirm the operation using the "Apply" button.

We will be returned to the "dashboard" section of the "Provisioning" module where we can view the outcome of the operations.

Figura 370 – Confirmation of "Edge" provisioning

11.0.3.4 Creation of a "Blueprint" provisioning request

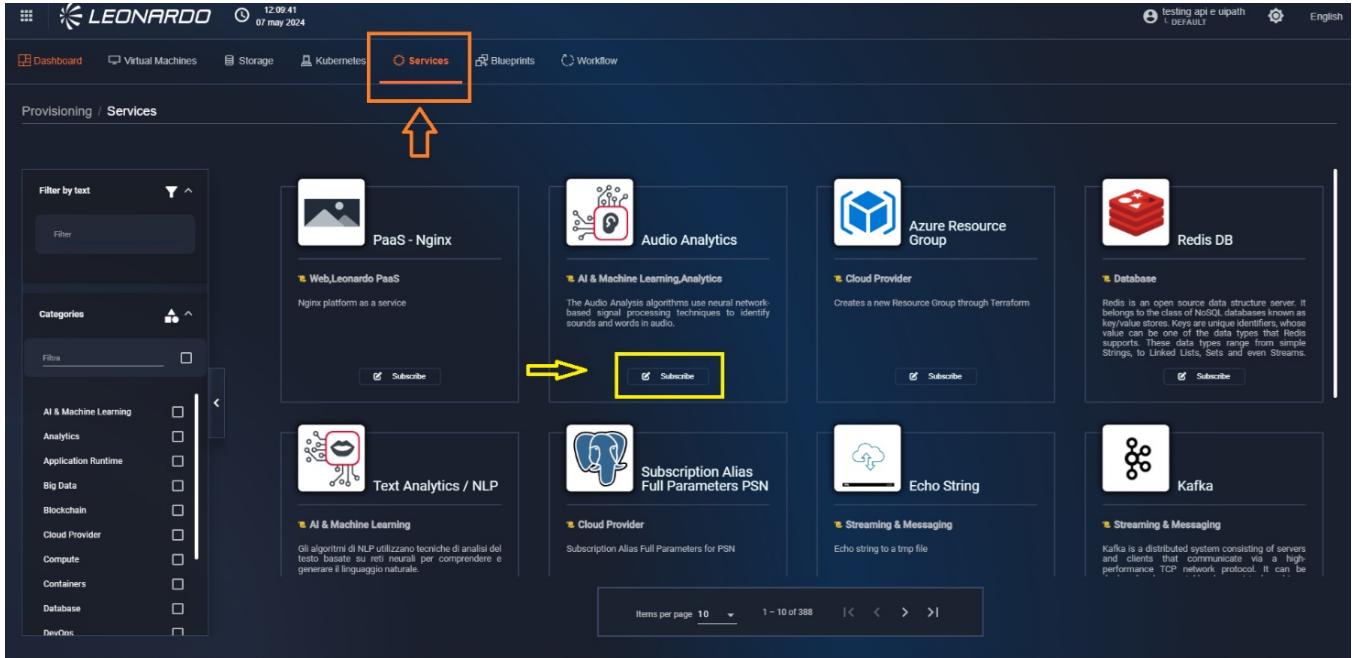

To access the services page, click on the "blueprint" tab in the top menu. After doing this, you will find yourself on the "Blueprints" page.

On the page, a list of components called "Card" is displayed. Each card refers to a specific type of service; in particular, the following information is displayed:

- Service name.
- Service icon.
- Type of script used for service provisioning.
- Service description.
- "Subscribe" button to proceed with service creation.

Depending on the blueprint selected, the parameters for provisioning change, while the

functionalities remain unchanged.

The screenshot shows the Leonardo Secure Cloud Management Platform interface. The top navigation bar includes tabs for Dashboard, Virtual Machines, Storage, Kubernetes, Services (highlighted with an orange box), Blueprints, and Workflow. Below the navigation, a sidebar lists categories like AI & Machine Learning, Analytics, Application Runtime, Big Data, Blockchain, Cloud Provider, Compute, Containers, Database, and DevOps. The main content area displays a grid of blueprints, each with a title, icon, description, and a 'Subscribe' button. The 'Audio Analytics' blueprint is highlighted with a yellow box around its 'Subscribe' button. Other visible blueprints include PaaS - Nginx, Azure Resource Group, Redis DB, Text Analytics / NLP, Subscription Alias Full Parameters PSN, Echo String, and Kafka.

Figura 371 – List of blueprints

11.0.3.4.1 "Blueprint" execution request

Click the "Subscribe" button corresponding to a "Blueprint". The user will be redirected to step 1 of the creation page. In this step, it is necessary to select the subsystem in which provisioning is to be performed from the dropdown.

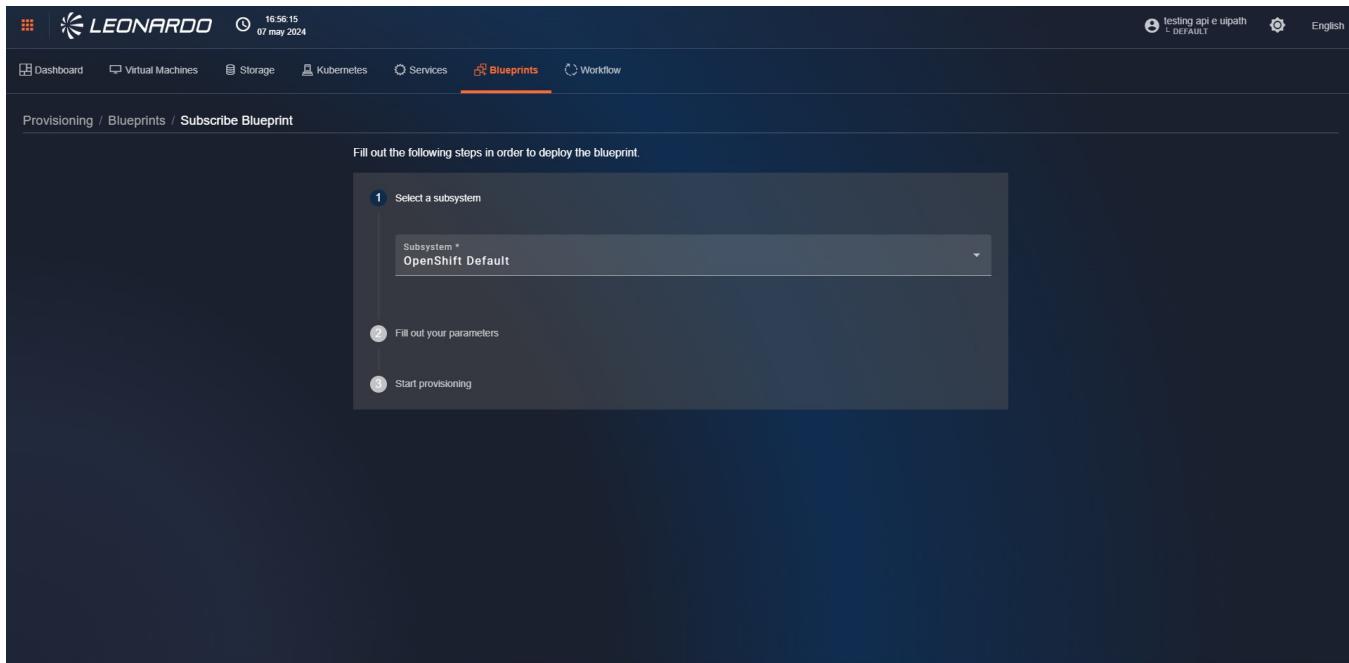

Figura 372 – Step 1 of Blueprint creation

By selecting a subsystem, the page will move to step 2 of creation where it will be necessary to fill out the form with the specific configuration parameters of the selected blueprint.

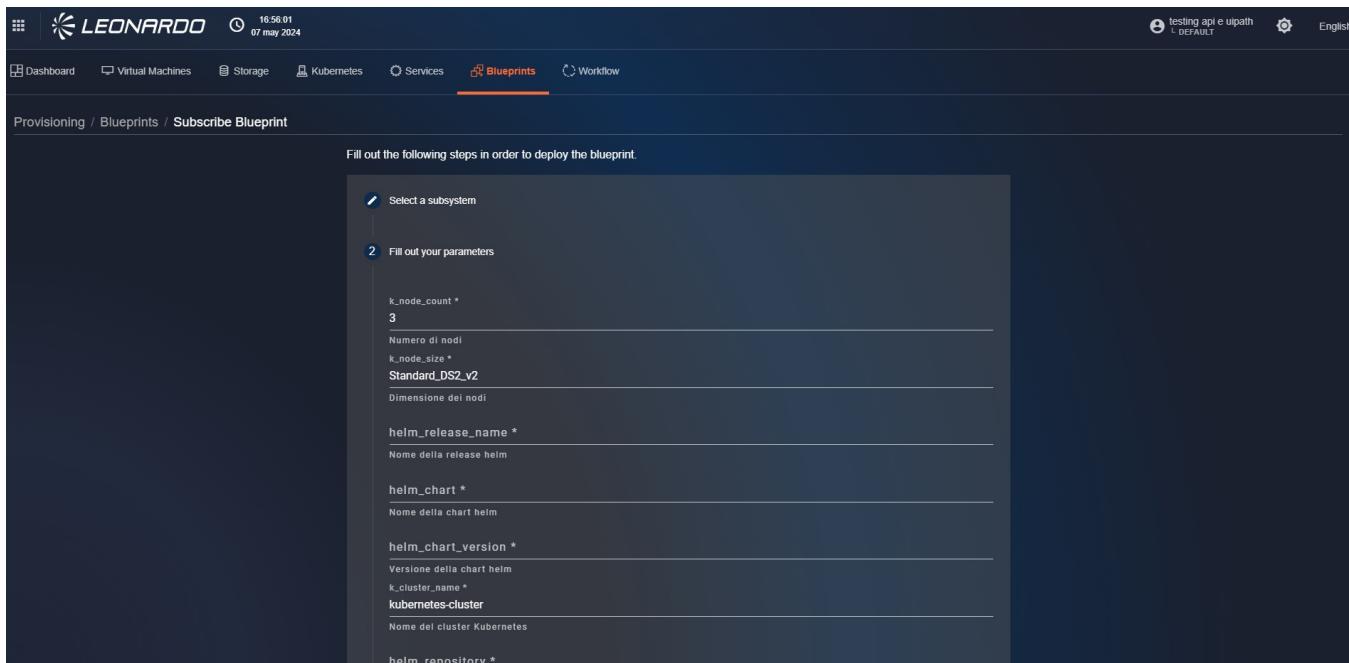

Figura 373 – Step 2 of "Blueprint" creation

Once the parameters have been entered, you can click the "Start" button at the bottom right to initiate provisioning. After a few seconds, you will be redirected to the "Dashboard" page, filtered for "Blueprints to be completed".

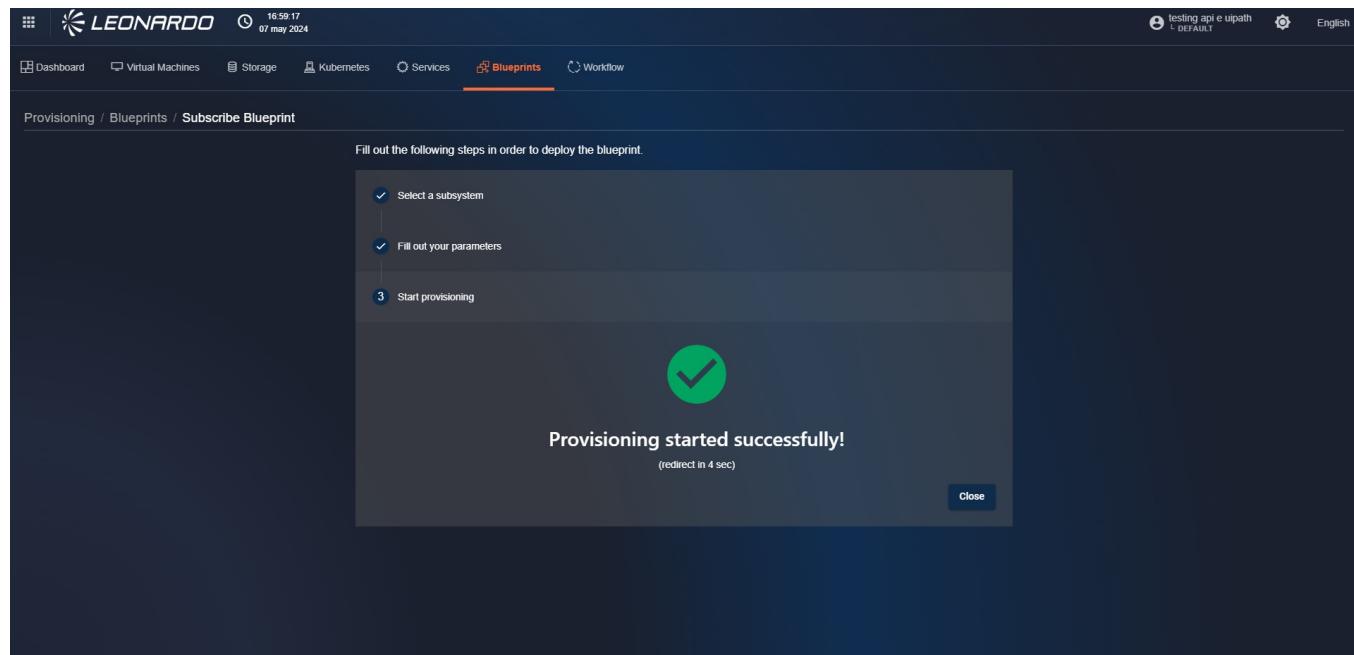

Figura 374 – Blueprint Request sent successfully

11.0.3.4.2 "To be completed" blueprint management page

To work on the blueprint, it is necessary to select a "to be completed" blueprint from the dashboard. Clicking on the corresponding row will display its management page.

This page is divided into sections, specifically:

- "Process Diagram": This section displays an image that graphically represents all the steps to be executed in the blueprint. Additionally, the step currently in execution is indicated in red.
- "Variables": In this section, we can view all parameters entered manually or automatically during the blueprint execution.
- "Task": In this section, it is possible to manage the blueprint steps that require manual intervention using the available controls.
- "Subprocess": In this section, we can view the status of all automatic operations performed during the blueprint execution.

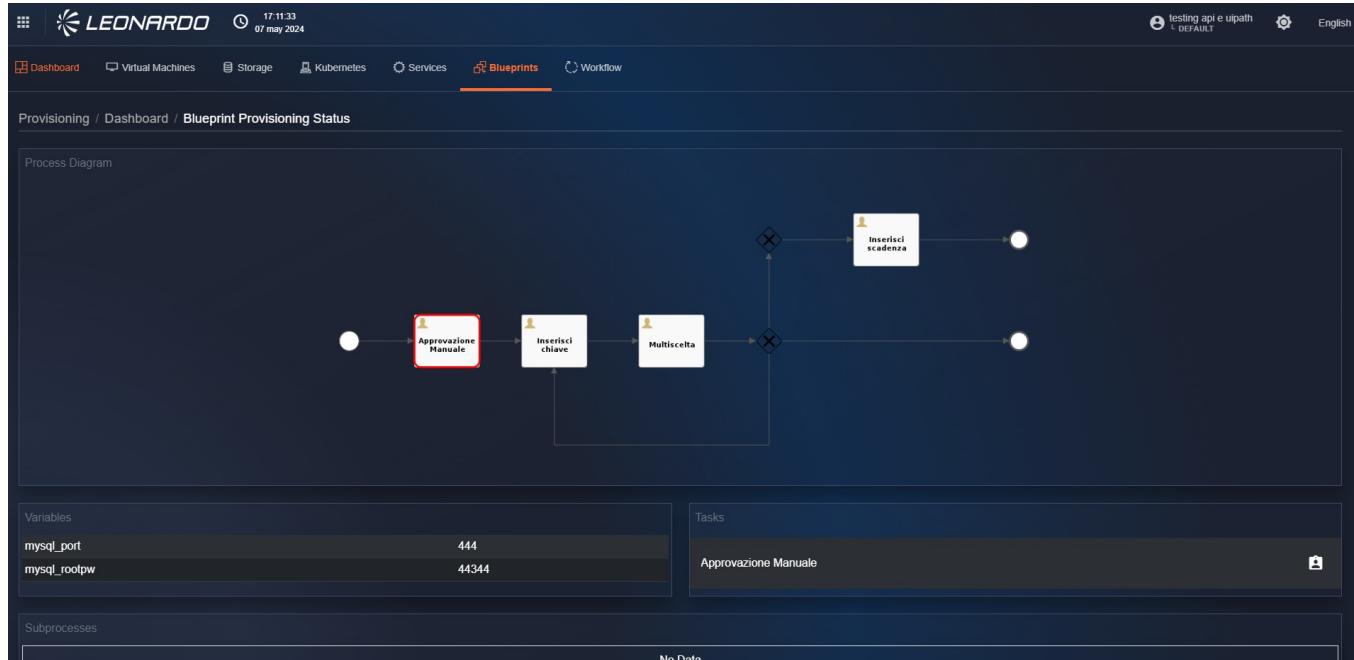

Figura 375 – Provisioning plan flow

The execution, and therefore the corresponding change, between the Blueprint steps can be carried out in two ways: automatically or manually, exactly as described within the Blueprint itself.

11.0.3.4.2.1 Automatic steps

The system automatically manages the creation, configuration of resources, and deployment of applications. The status and result of these steps are visible in the "Subprocess" section below.

For each row in the table, by clicking the buttons on the right, it is possible to verify the generated output message and download its content.

The screenshot shows the Leonardo Secure Cloud Management Platform interface. At the top, there is a navigation bar with links for Dashboard, Virtual Machines, Storage, Kubernetes, Services, Blueprints (which is currently selected), and Workflow. Below the navigation bar, there is a table titled "Blueprints" with the following data:

subnet_name	subnet
virtual_machine_name	docker-vm
virtual_network_name	vnet
vm_computer_name	docker-vm
vm_size	Standard_DS1_v2

Below the table, there is a section titled "Subprocesses" containing a table with two entries:

Name	Received Time	Sent Time	Status	Engine	Actions
Blueprint: 65d7199b5685f7c27a2563d3 process: 668e0f67-f670-11ee-b54c-3e32eeff42d95	09/04/2024 12:56:26	09/04/2024 14:55:11	✓	A	Edit Delete Download
Blueprint: 65d7199b5685f7c27a2563d3 process: 45be1896-f670-11ee-b54c-3e32eeff42d95	09/04/2024 12:55:11	09/04/2024 14:54:16	✓	B	Edit Delete Download

At the bottom right of the interface, there are buttons for "Output Message", "Items per page 10", and "Close".

Figura 376 – Blueprint subprocesses section

11.0.3.4.2.2 Manual steps

Manual tasks, when present and required in the blueprint, will appear in the relevant section. To work on it, it is first necessary to click the "Assign" button (red in the figure) to take charge of the task.

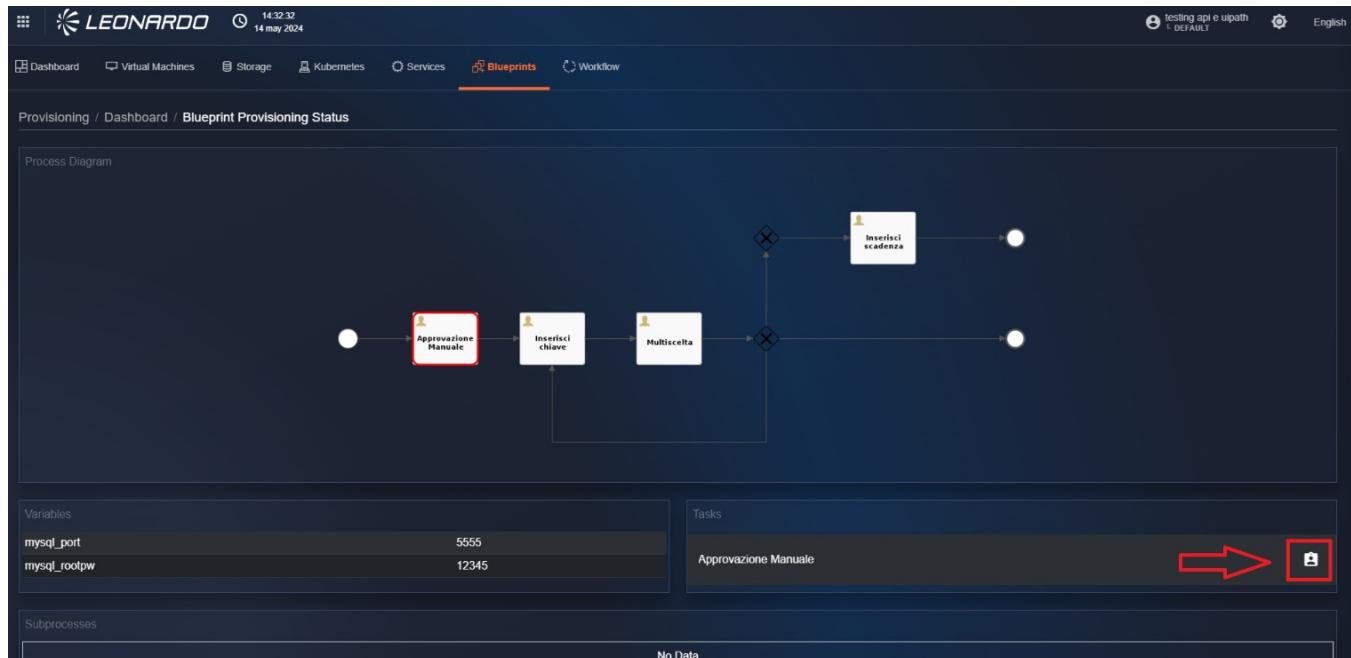

Figura 377 – Task assignment to the user

A confirmation modal for assignment will be displayed. By clicking "Yes", the task will be taken over by the user and cannot be worked on by a different user.

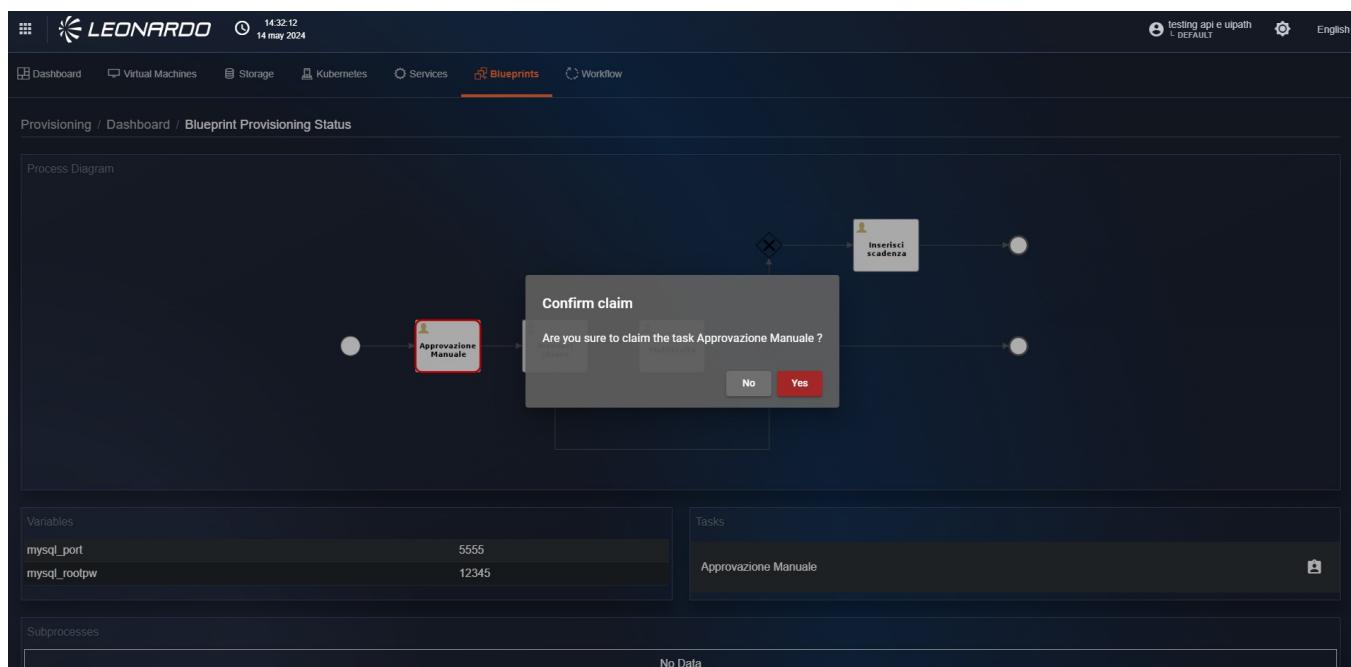

Figura 378 – Assignment confirmation

A confirmation message will appear at the bottom, and we can note that the "Task" section has been updated. On the left, below the task name, the relevant assignee is indicated, and on the right, there are 2 buttons:

- "Remove assignment" (red in the figure).
- "Complete manual task" (yellow in the figure).

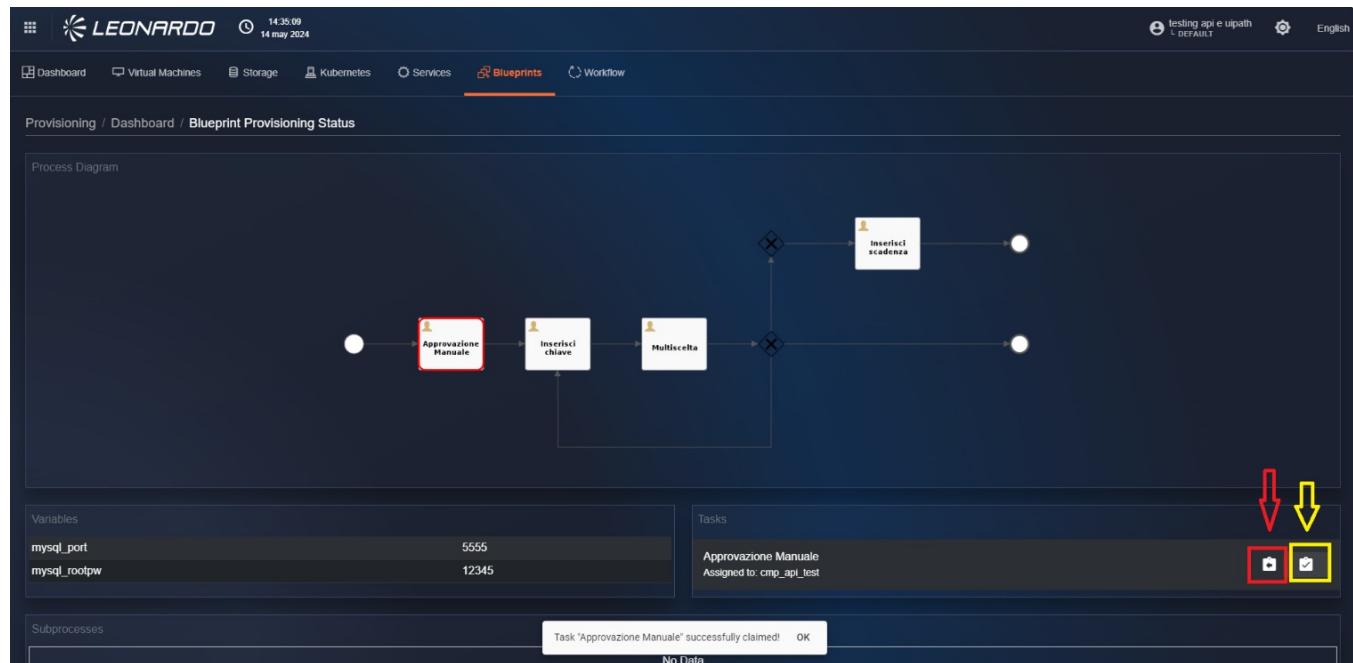

Figura 379 – Task management buttons

Clicking "Remove assignment" will open a confirmation modal. Clicking "Yes" will make the task available to other users who can take charge of it.

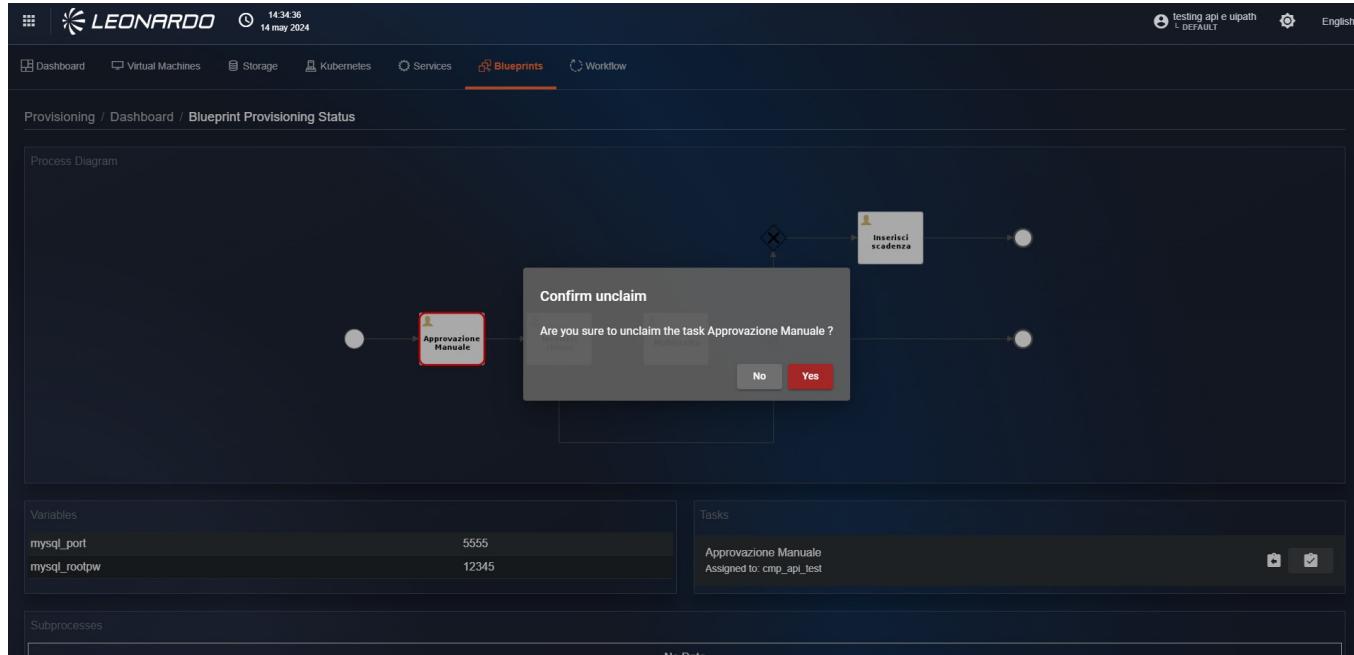

Figura 380 – Task release

Clicking the "Complete task" button will open a modal containing one or more customizable fields. The fields can be of different types.

We can enter numeric, boolean, and text fields. Once entered, it is possible to confirm by clicking the "Continue" button at the bottom right.

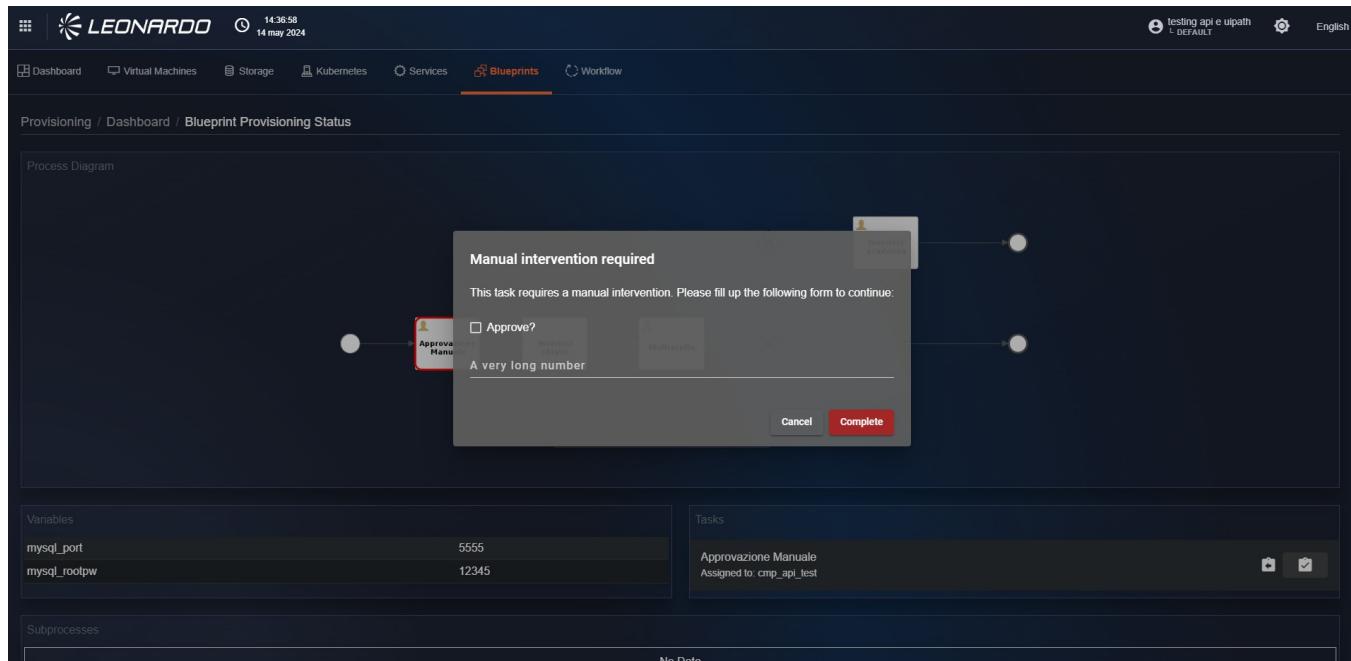

Figura 381 – Numeric fields of blueprints

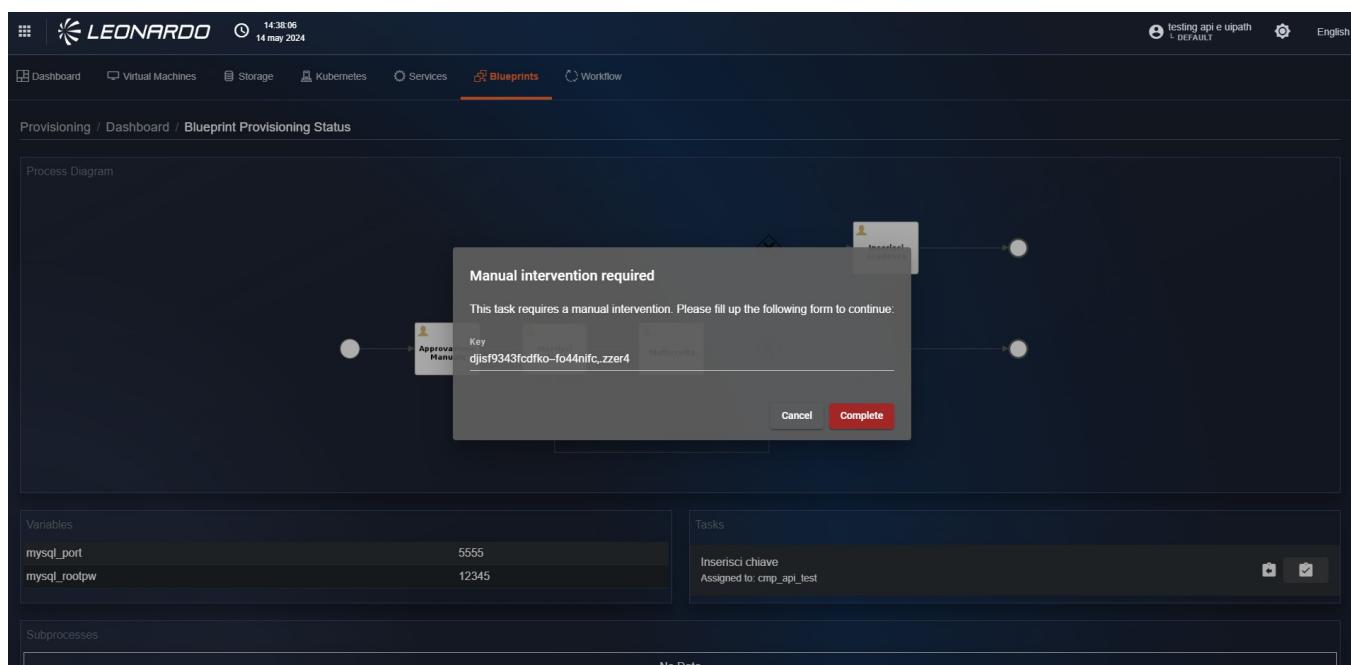

Figura 382 – Text fields in Blueprints

Once pressed, we can see that the BPMN graph on the page has been updated and that the next step of the blueprint is active and has a red outline.

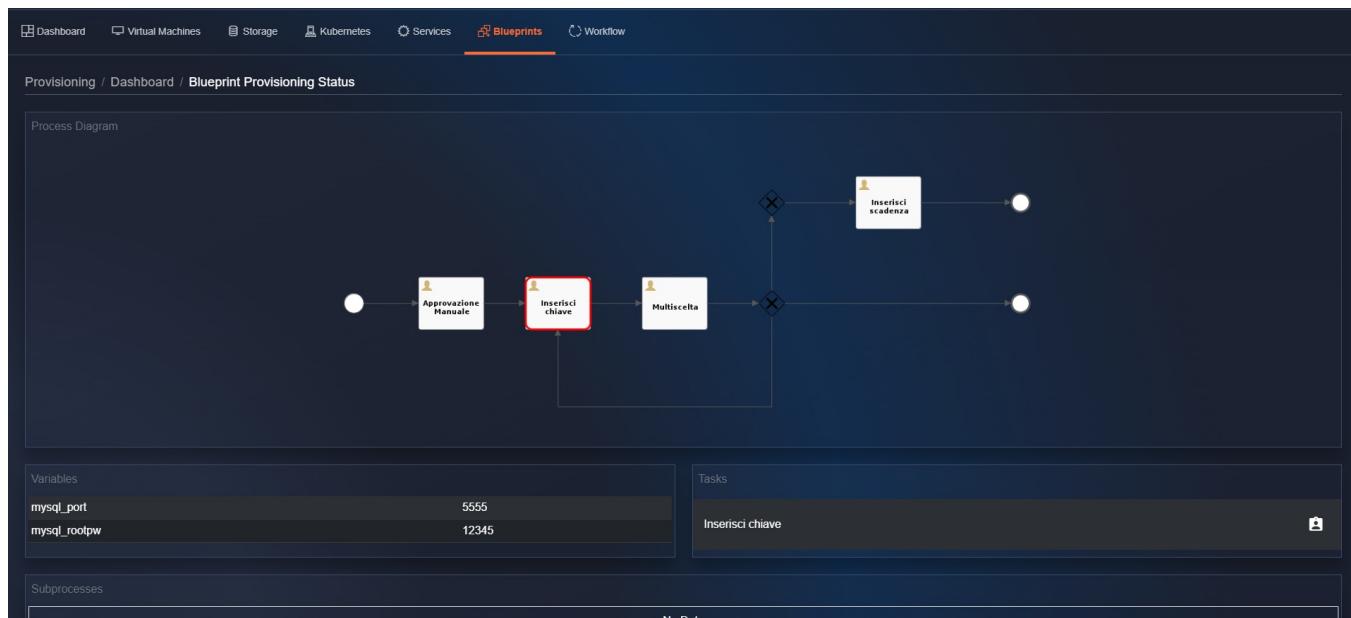

Figura 383 – Next step

All manual tasks present in the blueprint will follow the procedure described previously; therefore, regardless of the type of data to be entered, it is always necessary to assign the task to oneself.

It is possible to insert a temporal field within the manual steps of blueprints, using a calendar it will be possible to manually select the correct day and time.

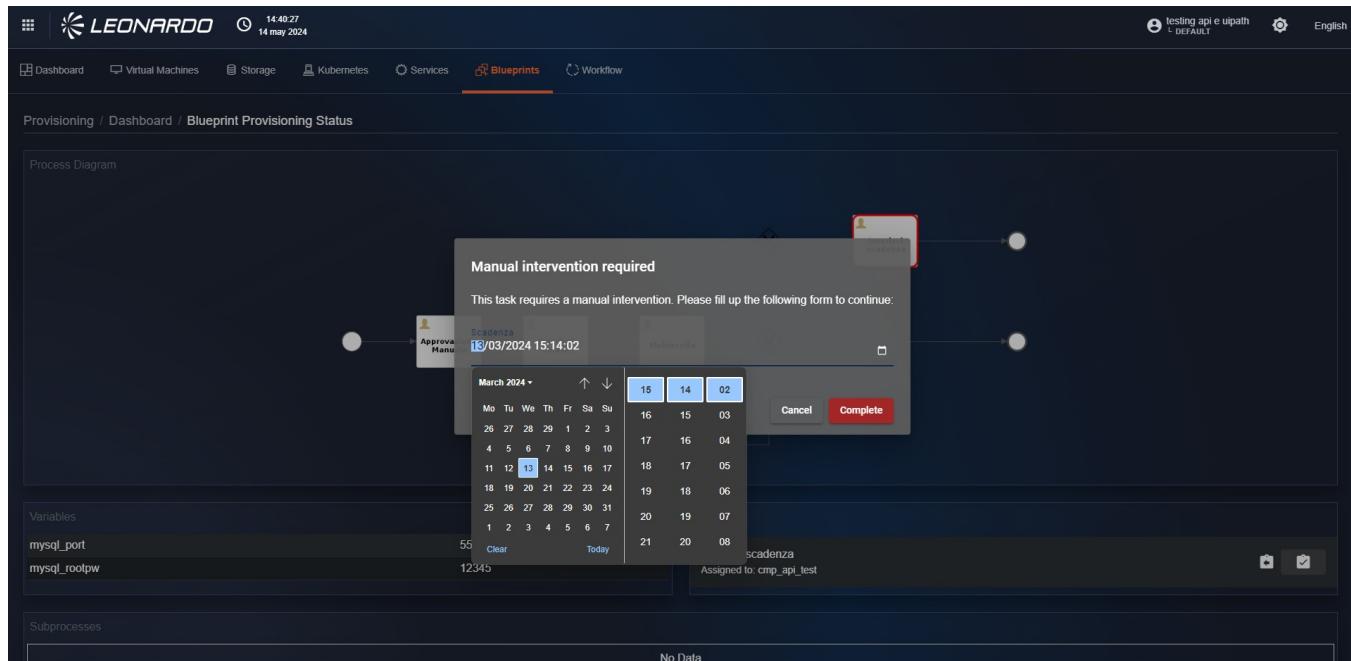

Figura 384 – Date field in tasks

The last type of step that we can find within the blueprints is the "Multi-choice" field. This field allows managing the blueprint's flow.

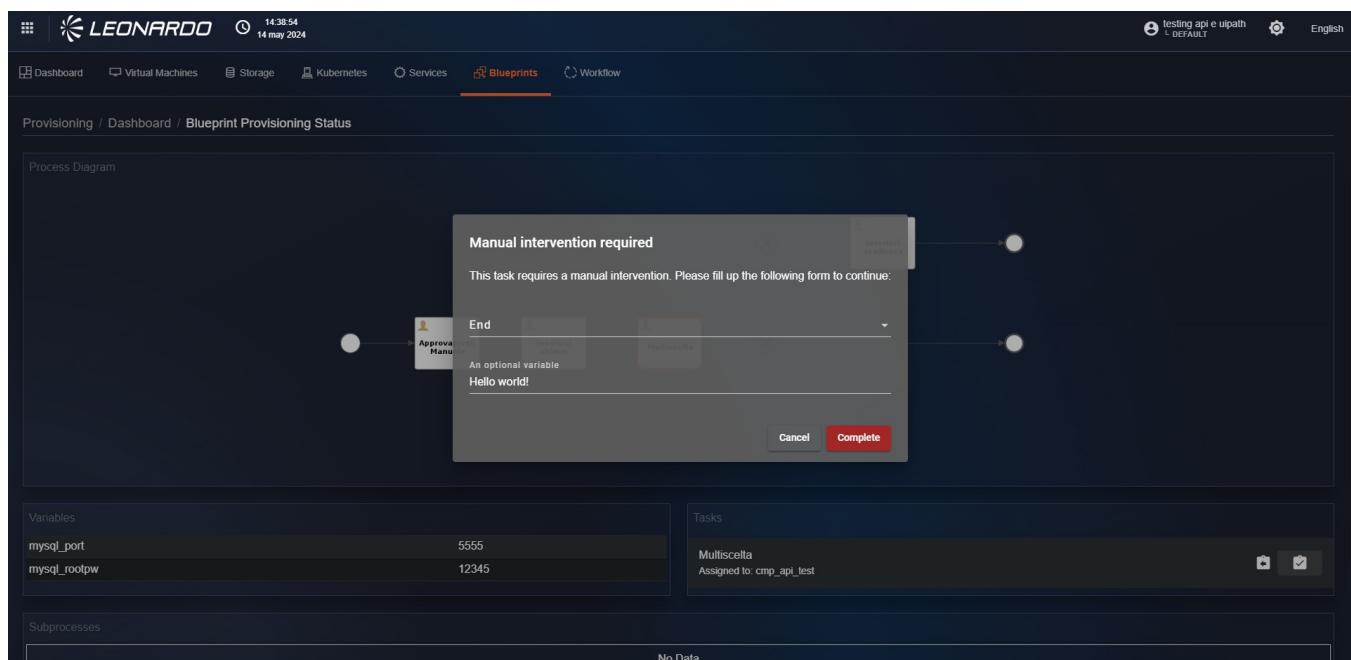

Figura 385 – Multi-choice field

This field is of "Selection" type, so it will not be possible to enter a custom value, but selectable options will be proposed. Specifically, we can find three choices:

- "Repeat": allows re-executing the previous steps as described in the blueprint (path in pink in the figure).
- "End": allows concluding the blueprint execution without performing further operations (path in yellow in the figure).
- "Insert date": allows moving to a subsequent step of the blueprint (path in green in the figure).

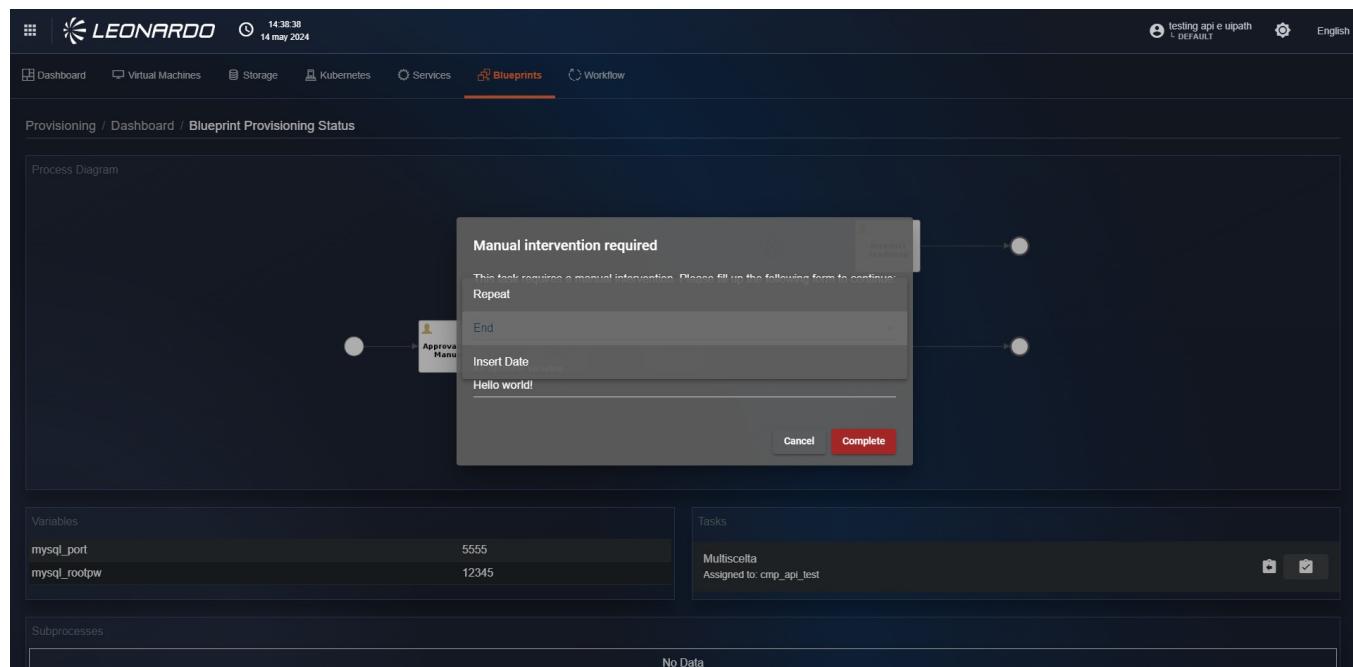

Figura 386 – Multi-choice field values

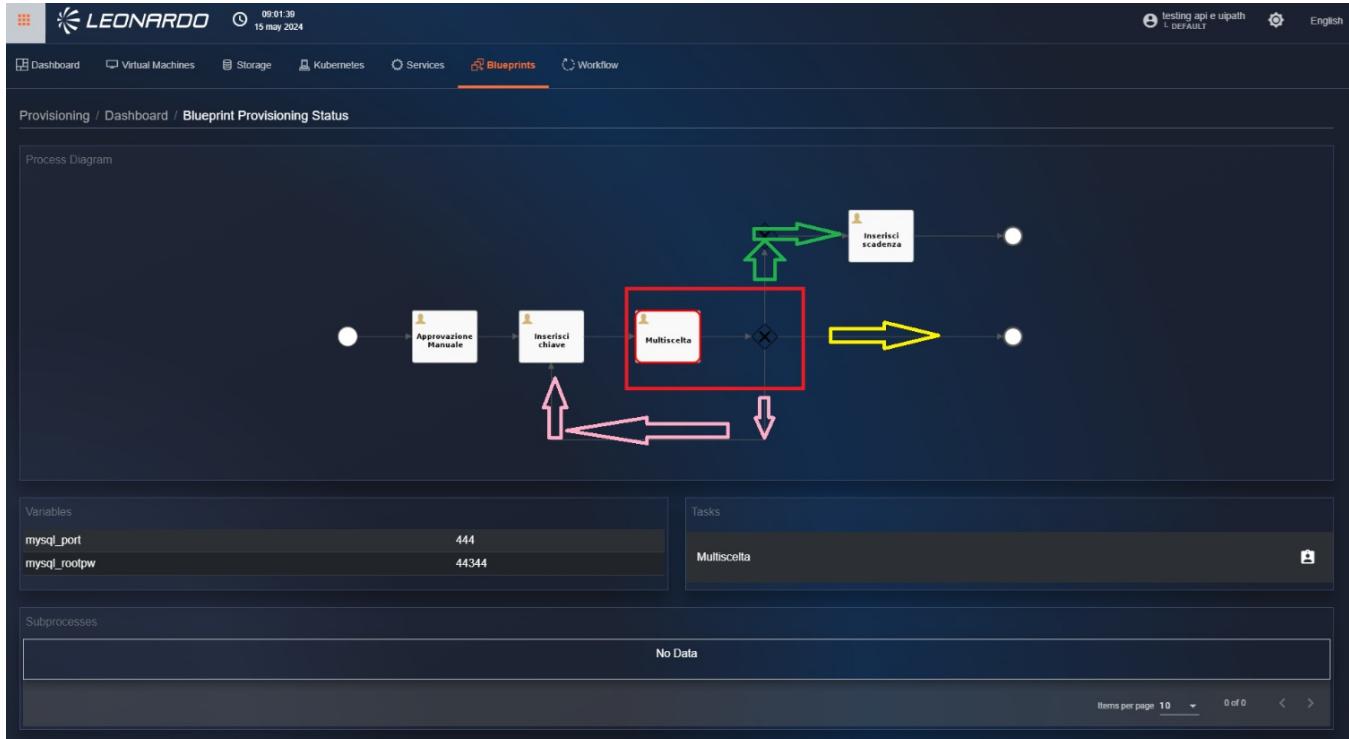

Figura 387 – Possible state changes for Multi-choice

Once all blueprint steps are completed, the graph will be automatically removed from the page, and in the step section, it will no longer be possible to take charge of an operation.

Furthermore, in the "sub-processes" section, we will be able to view the result of all automated steps in the blueprint.

The screenshot shows the Blueprint Provisioning Status page. In the Variables section, there are two entries: mysql_port with value 5555 and mysql_rootpw with value 12345. The Tasks section displays the message "No task currently available.".

Figura 388 – Blueprint completion

11.0.3.5 Modification of a performed provisioning

For a provisioning that has been carried out and has failed, it is possible to modify it.

Provisioning modification is only available for resource types.

To start modifying a provisioning, click on a failed forecast.

After clicking on “Switch Tenant”, a modal appears where you can select a Tenant to switch to. After selecting the desired Tenant, click on the “Confirm” button.

The system automatically verifies the tenant's enablement and existence before performing the switch.

After doing so, the page updates with the desired Tenant, where you can view all data belonging to it across all platform functionalities.

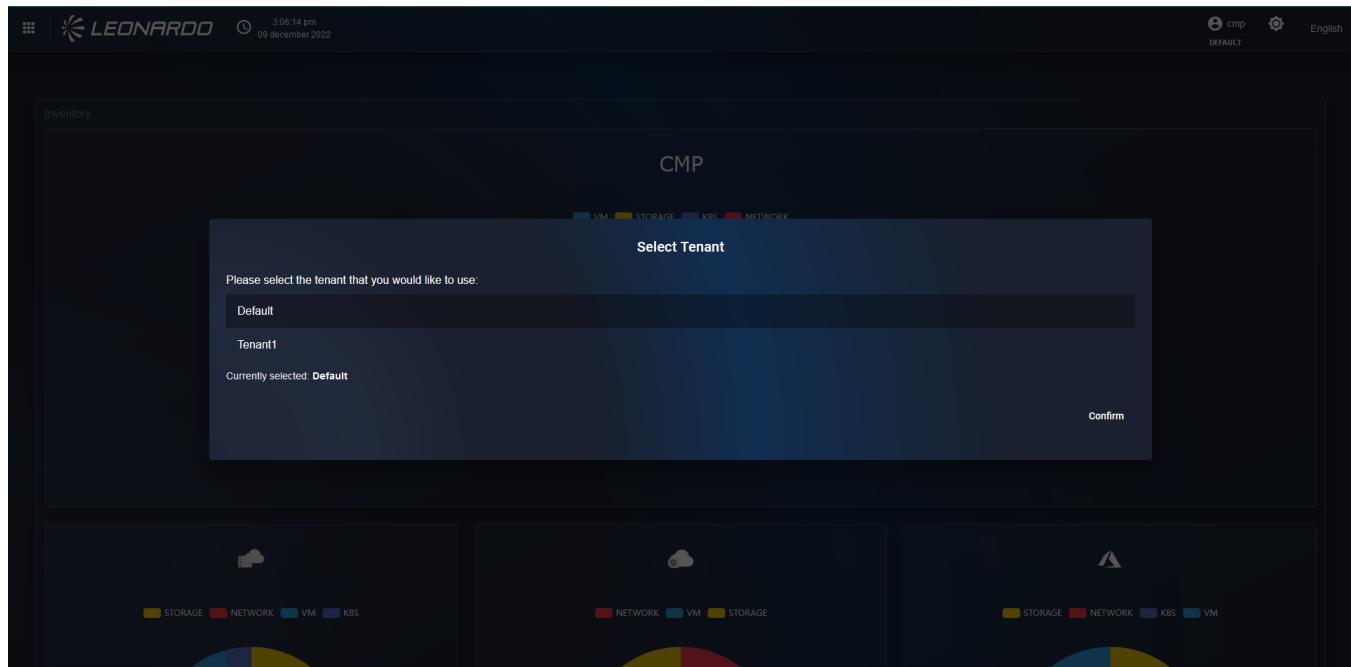

Figura 406 – Tenant Switch

Managing Columns in Available Tables

For the tables available in SCMP, the user has the ability to customize the column display in two ways:

- Modify the order of the displayed columns.
- Change the number of columns shown.

These preferences are saved within the system, using the user identifier and the current page as references.

To customize the display, it is necessary to click on the “filter columns” button, shown with a “funnel” icon, available in the top right section of the respective table.

Provider	Name	System	Size	Resource Group	Type	Creation Date	Confidential	Provisioned on	In Cat

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

The screenshot shows the 'Inventory / Resources' section of the Leonardo platform. A modal window titled 'Columns Options' is open, listing various columns: Provider, Name, System, Size, Resource Group, and Type. The 'Provider' column is highlighted with a red box and a red arrow points to it from the left. The 'Resource Group' column is highlighted with a yellow box and a yellow arrow points to it from the left. The 'Save' button at the bottom right of the modal is visible.

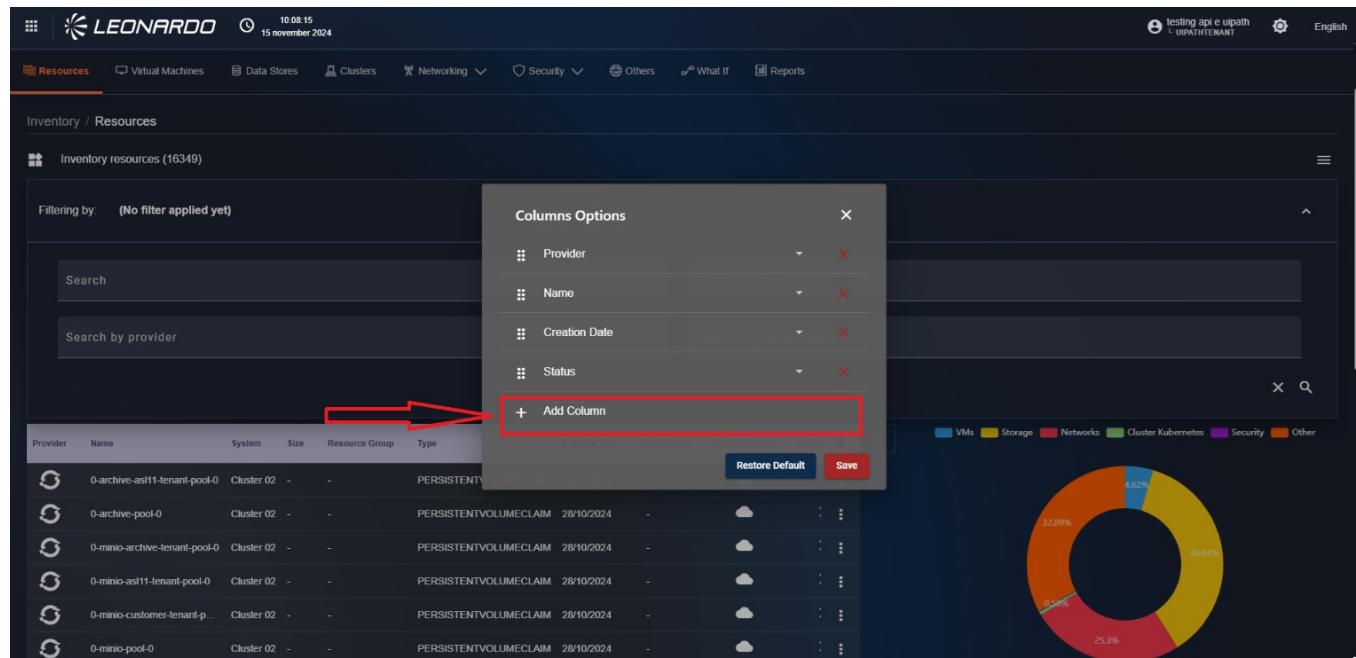

Figura 408 – Column Ordering

Additionally, it is possible to remove a field from the table by clicking on the red “X” corresponding to the field to be deleted; this will be removed from the list and, after saving, will also be removed from the table.

The screenshot shows the same 'Inventory / Resources' section with the 'Columns Options' modal open. The 'Provider' field now has a red 'X' icon next to its name, indicating it is being deleted. A red arrow points to this 'X' icon. The 'Save' button is visible at the bottom right of the modal.

Figura 409 – Deleting Columns

If we want to add a field to the table, it will be necessary to click the “Add column” button; once pressed, it will be replaced by a “select” field which contains the list of all available fields not already present in the table.

The screenshot shows a table of inventory resources with columns: Provider, Name, System, Size, Resource Group, and Type. A modal window titled "Columns Options" is open over the table. Inside the modal, there is a list of columns: Provider, Name, Creation Date, and Status, each with a red "X" icon to its right. At the bottom of this list is a button labeled "+ Add Column". A large red box and an arrow point to this "+ Add Column" button.

Figura 410 – Adding new column

Select the field to add to the table from the displayed list and complete the application by clicking the save button available in the bottom right.

The page will automatically refresh to display the new table; furthermore, the configuration will be saved automatically and automatically retrieved upon login.

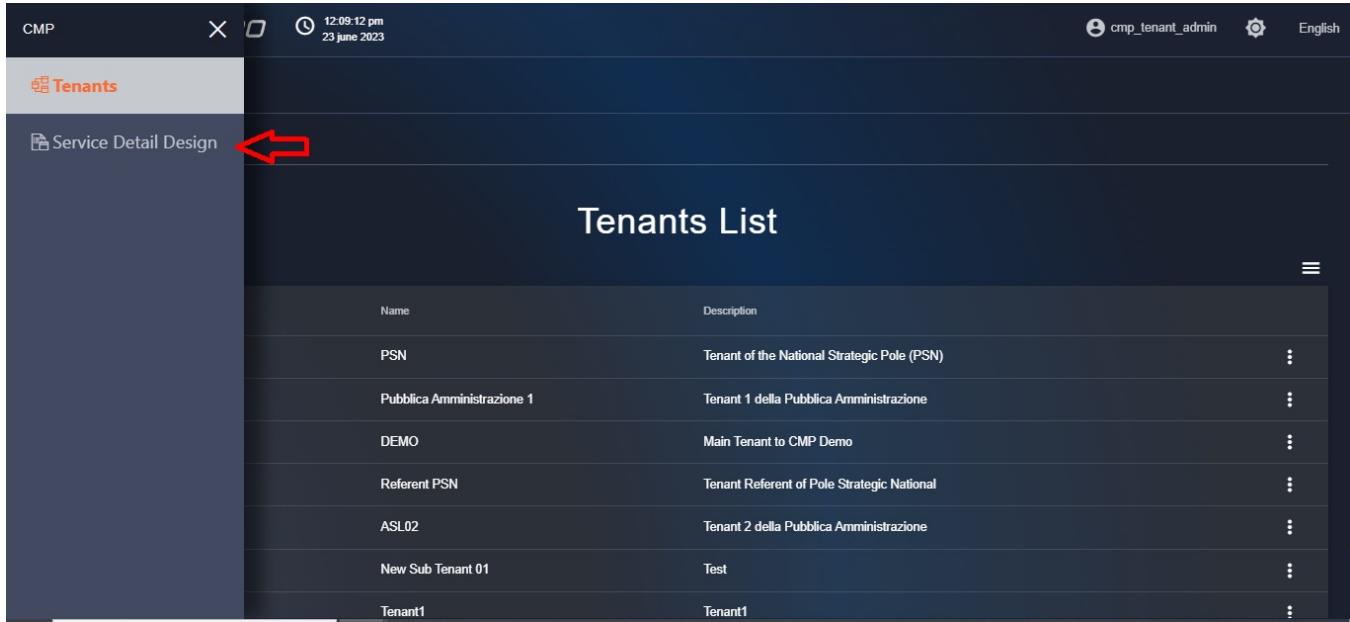

Figura 411 – Saving the view

Service Detail Design

The Service Detail Design service is the solution implemented for managing requests, which must then be processed within our environment by an authorized user.

To access Service Detail Design, log in to SCMP with the Service Manager user.

After logging in, click the "Service Detail Design" module from the bento button.

The screenshot shows the 'Tenants' module in the Secure Cloud Management Platform. The left sidebar has a 'Tenants' section. In the main area, there is a 'Tenants List' table with the following data:

Name	Description	Actions
PSN	Tenant of the National Strategic Pole (PSN)	⋮
Pubblica Amministrazione 1	Tenant 1 della Pubblica Amministrazione	⋮
DEMO	Main Tenant to CMP Demo	⋮
Referent PSN	Tenant Referent of Pole Strategic National	⋮
ASL02	Tenant 2 della Pubblica Amministrazione	⋮
New Sub Tenant 01	Test	⋮
Tenant1	Tenant1	⋮

Figura 412 – Access to Service Detail Design module

The search page will be shown where it is possible to filter already created work orders based on:

- Status
- Customer
- Service Type
- Phase
- Creation Date

The table will show the general information of the Work Order.

Leonardo Cyber & Security Solutions

15 Dec 2025

09.00

Secure Cloud Management Platform

The screenshot shows the 'Work Orders' section of the Leonardo Secure Cloud Management Platform. At the top, there are filtering options: 'Filtering by: DATE Apr 14, 2024 – May 14, 2024' and 'STATUS New, In progress... + 3 others'. Below these are search fields for 'Search by status' (New, In progress, Idle, Rejected, Completed) and 'Search by customer'. Further down are filters for 'Search by service type' (Select a phase) and 'Select a date range' (Last 30 days, 14/04/2024 – 14/05/2024). The main table lists work orders with columns: Order ID, Customer, Service Type, Creation Date, Last Update, Status, Phase, and Actions. Each row has a modal icon and a checkmark icon.

Order ID	Customer	Service Type	Creation Date	Last Update	Status	Phase	Actions
661c71a0bedf107659a55b75	840766	Servizi PSN	15/04/2024 00:15:28	15/04/2024 00:15:28	New	Deploy Service	► <input checked="" type="checkbox"/>
661cdd0bedf107659a55dae	840766	Servizi PSN	15/04/2024 07:57:36	15/04/2024 07:57:36	New	Deploy Service	► <input checked="" type="checkbox"/>
661dc31dbedf107659a55e77	840766	Servizi PSN	16/04/2024 00:15:25	16/04/2024 00:15:25	New	Deploy Service	► <input checked="" type="checkbox"/>
661f147cbef107659a560c0	840766	Servizi PSN	17/04/2024 00:14:52	17/04/2024 00:14:52	New	Deploy Service	► <input checked="" type="checkbox"/>
661fd4ac2941363637a859db	840766	Servizi PSN	17/04/2024 13:54:52	17/04/2024 13:54:52	New	Deploy Service	► <input checked="" type="checkbox"/>
662065cc2941363637a85ab1	840766	Servizi PSN	18/04/2024 00:14:36	18/04/2024 00:14:36	New	Deploy Service	► <input checked="" type="checkbox"/>

Figura 413 – Service Detail Design functionality filters

Click the center of a work order row to view its content; a modal will open where we can expand the various sections by clicking on them.

To exit the detail view, click outside the gray window.

Work Order Details

Order ID	Title	Service Type	Created	Last Updated	Status	Action
6499bb4258ab7a35a1fb9449	Gestione servizi cloud New	Servizi Cloud	26/06/2023 16:22:36	26/06/2023 16:22:38	New	Play
6499bb4958ab7a35a1fb9448	IC_SPA_2021	Servizi Cloud	26/06/2023 16:31:47	26/06/2023 17:52:56	In progress	Pause

Figura 414 – Work Order Details

Work Order Flow

To take charge of a work order, click the "Play" symbol next to an order in "New" status.

A status change notification will be displayed on the screen, and the current status of the Order becomes "In progress"; the buttons of the corresponding order are modified:

- by clicking the "Pause" button, the order will transition to "Idle" status;
- by clicking the "Mark as completed" button, it is possible to close the Work Order;
- by clicking the "Rejected" button, it is possible to report the cancellation of the Order;

Order ID	Customer	Service Type	Creation Date	Last Update	Status	Actions
6499bb4258ab7a35a1fb9446	IC_SPA_2021	Servizi Cloud	26/06/2023 16:22:26	26/06/2023 16:44:35	Completed	
6499bb4958ab7a35a1fb9448	IC_SPA_2021	Servizi Cloud	26/06/2023 16:22:33	26/06/2023 16:22:33	Completed	
6499bb4c58ab7a35a1fb9449	IC_SPA_2021	Servizi Cloud	26/06/2023 16:22:36	26/06/2023 16:23:20	Completed	
6499bb4e58ab7a35a1fb944a	IC_SPA_2021	Servizi Cloud	26/06/2023 16:22:38	26/06/2023 16:22:38	New	
6499bd73aadc040a6e3ccb49	IC_SPA_2021	Servizi Cloud	26/06/2023 16:31:47	26/06/2023 16:31:47	In progress	
6499c071c90c991e9b78ae8	IC_SPA_2021	Servizi Cloud	26/06/2023 16:44:33	26/06/2023 16:44:33	Idle	

Status updated successfully! OK

Figura 415 – Work order management page for Service Detail Design

When the “Mark as completed” button is clicked, a window is displayed on the screen where information to be attached to the order can be entered, specifically:

- the result of the processing;
- a description of the chosen result;
- a note for the operator.

Leonardo Cyber & Security Solutions

Secure Cloud Management Platform

The screenshot shows a 'Work Orders' interface. On the left, there's a sidebar with filtering options like 'Order ID', 'Search by status' (New, In progress, Idle, Rejected), and 'Search by service type'. The main area lists several work orders with columns for 'Order ID', 'Status', 'Start Date', 'End Date', and 'Outcome'. A modal window titled 'Close Order' is open in the center. It has a dropdown for 'Select an outcome for this order' with '(Select an outcome)' as the placeholder. Below it is a text area 'Explain why you chosen this outcome:' with a placeholder 'Type here the reason(s)'. At the bottom of the modal, there's a section for 'Do you want to leave a note to the operator?' with a text input field 'Type here your note...' containing 'IO_SPA_2021'. A 'Finish' button is located at the bottom right of the modal.

Figura 416 – Closing a Work order

By scrolling down the page, we can find the parameters section where it is possible to enter different key/value combinations for the parameters used during processing.

After entering the key and value, click the “Plus” button to confirm the entry; new empty fields are added where additional parameters can be entered. To delete a key/value pair, click the “Minus” button; once all parameters have been entered, click the “Finish” button.

Close Order

Do you want to leave a note to the operator?

Type here your note...

KEY	IC_SPA_2021	Servizi Cloud	20/06/2023 16:34:36	20/06/2023 16:34:36	Completed

15 Leonardo Services

Leonardo provides several managed services which are represented in the following figure by type (called service families).

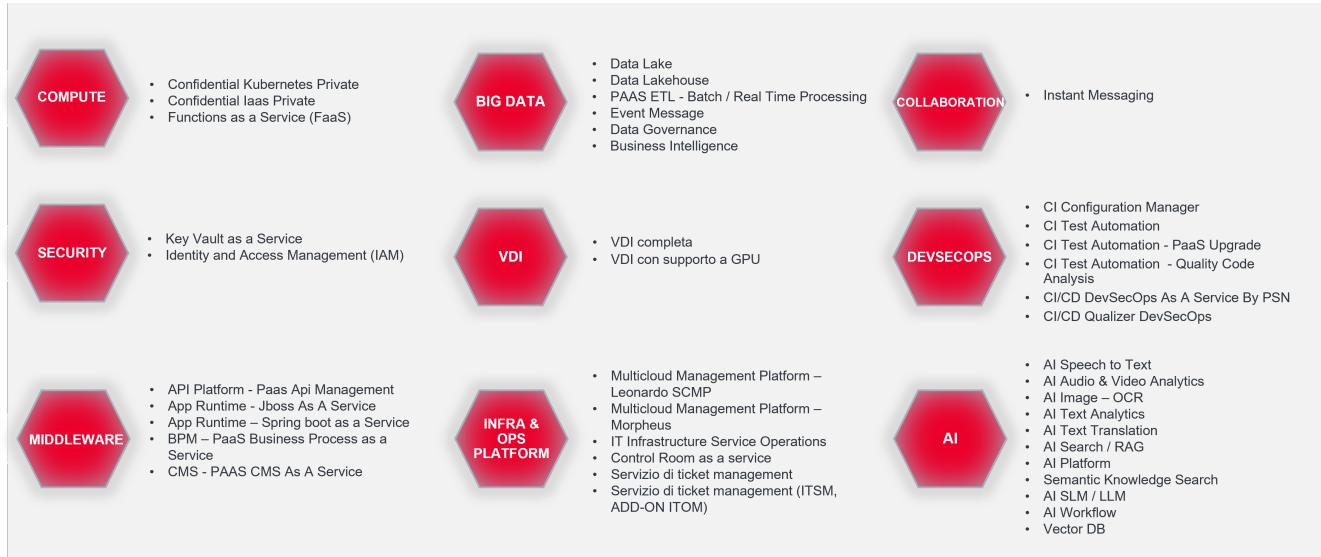

Figura 419 – Overview Leonardo Services

From a logical-functional point of view, the services can be divided into three macro-categories:

- Infrastructure as a Service (IaaS) Services
- Container as a Service (CaaS) Services
- Platform as a Service (PaaS) Services

The IaaS and CaaS categories include some services from the "Compute" family. The PaaS category includes services from all other families.

The aforementioned macro-categories will be described below.

15.1 Infrastructure as a Service (IaaS) Services

In the following table, you can consult the services pertaining to the Infrastructure as a Service (IaaS) category.

FAMILY	SUB-FAMILY	SERVICE NOMENCLATURE
--------	------------	----------------------

FAMILY	SUB-FAMILY	SERVICE NOMENCLATURE
Compute	Confidential - IaaS - Private	<ul style="list-style-type: none"> - Pool Small (Confidential) - Pool Medium (Confidential) - Pool Large (Confidential) - Pool X-Large (Confidential)

15.1.1 Compute

Below are the sub-families pertaining to the Compute family: - Confidential - IaaS - Private

15.1.1.1 Confidential - IaaS - Private

Below is the list of services pertaining to the Confidential - IaaS - Private sub-family:

- Pool Small (Confidential)
- Pool Medium (Confidential)
- Pool Large (Confidential)
- Pool X-Large (Confidential)

"Service Description"

The services allow for the provision of virtual computational environments (IaaS) of Private type, i.e., on a pool of physical resources, dedicated and isolated for each individual client, based on the use of "bare metal" compute instances. The data of the physical resources are encrypted and kept protected in all phases of their use (At-Rest, In-transit & In-use), leveraging the Confidential Computing paradigm. Depending on the pool of computational resources required for each individual Administration, it is possible to choose the most suitable service from the four available types.

"Service Features and Benefits"

Private Cloud resources are exclusively dedicated to each client. The services use secure Enclaves based on Trusted Execution Environment (TEE) leveraging HW Confidential, which offer an advanced level of security for data in use, protecting them during processing. They support advanced data encryption at Rest, in Transit & in Use. They use advanced Remote Attestation systems to verify the correctness of the TEE environment, isolating the memory of virtual machines from the host operating system and other malicious guests.

The advantages offered by the services are:

- Security and confidentiality of data in dedicated environments;
- Workload isolation through advanced virtualization;
- Dedicated firewalls and network micro-segmentation;
- Automated provisioning and rapid resource management;
- Total control and centralized governance: centralized monitoring and auditing for traceability.

15.2 Container as a Service (CaaS) Services

In the following table, you can consult the services pertaining to the Container as a Service (CaaS) category.

FAMILY	SUB-FAMILY	SERVICE NOMENCLATURE
Compute	Confidential - Kubernetes - Private	Kubernetes Confidential Computing

15.2.1 Compute

Below are the sub-families pertaining to the Compute family: - Confidential - Kubernetes - Private

15.2.1.1 Confidential - Kubernetes - Private

Below is the list of services pertaining to the Confidential - IaaS - Private sub-family:

- Kubernetes Confidential Computing

"Service Description" Service that allows the provision of a platform for the orchestration of private and secure containers, designed to manage containerized applications in highly regulated environments or with confidentiality requirements. It offers a secure and controlled

Kubernetes environment where the security component is one of the main aspects of the solution. The operating system on which the solution is based is hardened, to minimize the attack surface and potential vulnerabilities. Within the architectural components of the solution, mechanisms are used to ensure data security even during communication phases (through encryption mechanisms applied by default to communications between platform components) and for data stored within the platform itself. The platform can be customized to adapt to the specific needs of each Organization, ensuring integration with existing corporate systems and applications.

"Service Features and Benefits" Its implementation requires a combination of hardware certified for Confidential Computing, a security-hardened private Kubernetes infrastructure, and a set of observability and governance tools to maintain total control over the container lifecycle. Included functionalities:

- *Data protection* → the operating system is configured to ensure protection in all its phases: data in memory, through full disk encryption and key rotation; data in transit, using secure and encrypted communication protocols; data in use, adopting Confidential Computing practices and secure execution environments.
- *Secure Enclaves* → apply isolation and encryption, ensuring that only authorized parties can access the data.
- *Trusted Execution Environments (TEE)* → add a secure processing environment, protecting data from external threats.

Being a managed Kubernetes solution, the client will not have to deal with infrastructure management and its complexity, as the infrastructural layer is managed by Leonardo throughout the service lifecycle.

The advantages offered are:

- Security and confidentiality of containerized applications: end-to-end encryption, confidential computing for workloads, container isolation on dedicated nodes with hardware-based protection, integrated security policies, and advanced RBAC;
- Centralized control and governance of clusters;
- Scalability and flexibility;
- Integration with multicloud and legacy environments.

15.3 Platform as a Service (PaaS) Services

In the following table, you can consult the services pertaining to the Platform as a Service (PaaS) category.

FAMILY	SUB-FAMILY	SERVICE NOMENCLATURE
Compute	FAAS	Functions as a Service
Security	IAM	Identity & Access Management Service
Security	Key Management	Key Vault as a Service
Middleware	API Platform	PaaS API Management
Middleware	APP Runtime	Jboss as a Service
Middleware	APP Runtime	Spring boot as a Service
Middleware	BPM	PaaS Business Process as a Service
Middleware	CMS	PaaS CMS as a Service
Middleware	ETL	PaaS ETL - Batch / Real Time Processing - 1 worker
Infra & Ops Platform	Multicloud Management	Multicloud Management Platform-Leonardo SCMP
Infra & Ops Platform	Multicloud Management	Multicloud Management Platform-Morpheus
Infra & Ops Platform	Observability-Infra	Control Room as Service

FAMILY	SUB-FAMILY	SERVICE NOMENCLATURE
Infra & Ops Platform	Observability-Infra	IT infrastructure Service Operations (Logging & Monitoring)
Infra & Ops Platform	TTM	PaaS Ticket Management Service
Infra & Ops Platform	TTM	PaaS Ticket Management Service (ITSM)
Infra & Ops Platform	TTM	PaaS Ticket Management Service (ADD-ON ITOM)
DevSecOps	CI	Configuration Manager
DevSecOps	CI	Test Automation
DevSecOps	CI	Quality Code Analysis
DevSecOps	CI/CD	DevSecOps As A Service By PSN
DevSecOps	CI/CD	Qualizer DevSecOps
Big Data	Data Lake	Data Lake - 1TB
Big Data	Data Lakehouse	Data Lakehouse
Big Data	Business Intelligence	Business Intelligence
Big Data	ETL	Batch/Real time Processing - 1 Worker

FAMILY	SUB-FAMILY	SERVICE NOMENCLATURE
Big Data	Event Platform	Event Message
Big Data	Data Governance	Data Governance
AI	AI - Audio & Conversations	Speech to Text
AI	AI - Image	OCR
AI	AI - Text	AI Search - AI Search - RAG - 10 GB - 1 worker
AI	AI - Text	Text Analytics
AI	AI - Text	Translation
AI	AI - Generative	AI SLM/LLM
AI	AI - Tools	AI workflow
AI	AI - Tools	Vector DB
AI	AI - Tools	AI Platform
VDI	Virtual Desktop	VDI
VDI	Virtual Desktop	VDI with GPU Support
Collaboration	Communication	Instant Messaging

15.3.1 Compute

Below are the sub-families pertaining to the Compute family: - FAAS

15.3.1.1 FAAS

Below is the list of services pertaining to the FAAS sub-family:

- Functions as a Service

"Service Description"

FaaS (Function as a Service) is a system design model, event-driven, executed on stateless containers, where developers create, deploy, and run small, independent functions to perform specific tasks without worrying about the underlying infrastructure. The adoption of FaaS allows for the standardization of application development and execution, centralizing cross-functional capabilities such as orchestration, automatic provisioning, monitoring, integrated service management, and event-driven flow control. It offers tools for:

- centrally manage serverless functions;
- automate component lifecycle management;
- enable multi-cloud and hybrid cloud portability;
- support innovation with GPU runtimes and dedicated AI tools. The FaaS platform provides and scales underlying resources based on demand. It is ideal for highly dynamic scenarios, with variable workloads, and integrates seamlessly with microservices and event-driven architectures.

"Service Features and Benefits" The service is not limited to providing an execution engine, but offers a complete ecosystem, composed of:

- *Serverless execution* → stateless functions and event-driven workflows, scalable and available in various programming languages.
- *Portability and independence* → executable on any Kubernetes cluster, multi-environment, without lock-in constraints.
- *Security and compliance* → data protection and centralized access management.
- The solution allows organizations to adopt a modern and flexible model, reducing operational complexity and benefiting from a standardized and easily accessible service.

The service is delivered via Apache OpenServerless, an open-source, cloud-agnostic serverless platform based on Apache OpenWhisk as a Function-as-a-Service (FaaS) engine.

The advantages offered are:

- *Reduction of operating costs* → you only pay for the actual use of the functions;
- *Flexibility and scalability* → resources adapt to demand;
- *Operational efficiency* → elimination of direct server management, patching, and updates;
- *High availability* → integrated redundancy and fault tolerance, ensuring high availability of functions even in the event of hardware failures or other interruptions;
- *Accelerated time-to-market* → rapid release of new functionalities without worrying about

the infrastructure;

- *Development agility* → focus on code and business logic, not on server management;
- *Continuous innovation* → rapid experimentation with new low-cost services;
- *Competitive advantage* in cost and speed compared to traditional hosting models.

16 REST API
